Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury will result if proper precautions are not taken.
--

WARNING
--

indicates that death or severe personal injury may result if proper precautions are not taken.

CAUTION
--

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.
--

CAUTION

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

NOTICE

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.
--

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
--

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be adhered to. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

SINAMICS documentation

The SINAMICS documentation is organized in two parts:

- General documentation / catalogs
- Manufacturer / service documentation

This documentation is part of the manufacturer/service documentation for SINAMICS. All of the documents are available individually.

At <http://www.siemens.com/motioncontrol/docu> information is available on the following topics:

- Order documentation
Here you can find an up-to-date overview of publications
- Download documentation
Links to more information for downloading files from Service & Support
- Documentation online
Information on DOConCD and direct access to the publications in DOConWeb.
- Assemble documentation individually on the basis of Siemens content with the My Documentation Manager (MDM), see <http://www.siemens.com/mdm>
The My Documentation Manager offers you a range of features for creating your own machine documentation.
- Training and FAQs
Information on the range of training courses and FAQs (frequently asked questions) are available via the page navigation.

Standard scope

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied. Other functions not described in this documentation might be able to be executed in the drive system. This does not, however, represent an obligation to supply such functions with a new controller or when servicing. The machinery construction OEM documents supplements or changes that he makes (the machinery construction OEM).

Further, for the sake of simplicity, this documentation does not contain all detailed information about all types of the product and cannot cover every conceivable case of installation, operation or maintenance.

Audience

This documentation is aimed at machine manufacturers, plant engineers, commissioning engineers, and service personnel who use SINAMICS.

Objective

This manual describes the hardware components of the SINAMICS S system. It provides information about installation, electrical connection, and cabinet design.

Technical support

If you have any questions, please contact our hotline:

European and African time zone	
Telephone	+49 (0) 911 895 7222
Fax	+49 (0) 911 895 7223
Internet	http://www.siemens.com/automation/support-request

America time zone	
Telephone	+1 423 262 2522
Fax	+1 423 262 2200
Internet	techsupport.sea@siemens.com

Time zone Asia/Pacific	
Telephone	+86 1064 757 575
Fax	+86 1064 747 474
Internet	support.asia.automation@siemens.com

Note

You will find telephone numbers for other countries for technical support on the Internet:
<http://www.automation.siemens.com/partner>

Spare parts

You will find spare parts on the Internet at:
<http://support.automation.siemens.com/WW/view/en/16612315>.

Internet address for SINAMICS

<http://www.siemens.com/sinamics>

EC Declarations of Conformity

The EC Declaration of Conformity for the EMC Directive and for the Low Voltage Directive can be found/obtained from the relevant regional office of the I DT MC and I DT LD Business Units of Siemens AG.

ESD information

CAUTION

Electrostatic sensitive devices (ESD) are single components, integrated circuits or devices that can be damaged by electrostatic fields or electrostatic discharges.

Regulations for handling ESD components:

- During the handling of electronic components, pay attention to the grounding of the person, workplace and packaging!
- Personnel in ESD areas with conductive flooring may only handle electronic components if:
 - They are grounded with an ESD wrist band
 - They are wearing ESD shoes or ESD shoe grounding straps
- Electronic components should be touched only when this is unavoidable. They must only be handled on the front panel or, in the case of printed circuit boards, at the edge.
- Electronic components must not be brought into contact with plastics or clothing made of artificial fibers.
- Electronic components may only be placed on conducting surfaces (table with ESD coating, conducting ESD foamed material, ESD packing bag, ESD transport container).
- Electronic components may not be placed near display units, monitors or televisions (minimum distance from the screen > 10 cm).
- Measurements must only be taken on boards when the measuring instrument is grounded (via protective conductors, for example) or the measuring probe is briefly discharged before measurements are taken with an isolated measuring device (for example, touching a bare metal housing).

Safety information

DANGER

SINAMICS S equipment must only be commissioned by suitably qualified personnel.

The personnel must take into account the information provided in the technical customer documentation for the product, and be familiar with and follow the specified danger and warning notices.

When electrical equipment and motors are operated, the electrical circuits automatically conduct a dangerous voltage.

Dangerous mechanical movements of the driven machine components are possible during system operations.

All work on the electrical system must be carried out when the system has been disconnected from the power supply and is in a no-voltage condition.

DANGER

Five safety rules

When carrying out any kind of work on electrical devices, the "five safety rules" according to EN 50110 must always be observed:

1. Disconnect the system.
2. Protect against reconnection.
3. Make sure that the equipment is de-energized.
4. Ground and short-circuit.
5. Cover or enclose adjacent components that are still live.

WARNING

Correct and safe operation of SINAMICS S units assumes correct transportation in the transport packaging, correct long-term storage in the transport packaging, setup and installation, as well as careful operation and maintenance.

The details in the catalogs and proposals also apply to the design of special equipment versions.

In addition to the danger and warning information provided in the technical customer documentation, the applicable national, local, and plant-specific regulations and requirements must be taken into account.

According to EN 61800-5-1 and UL 508, only safely isolated protective extra-low voltages on the electronic modules may be connected to any of the terminals on the electronic modules.

Note

When operated in dry operating areas, SINAMICS equipment with AC motors conforms to Low-Voltage Directive 2006/95/EC.

Note

In the configuration specified in the corresponding EC Declaration of Conformity regarding EMC requirements and when the EMC installation guideline (order no. 6FC5297-0AD30-0*P2) is observed, SINAMICS devices conform to EMC Directive 89/336/EEC and 2004/108/EC.

(*A: German; *B: English)

NOTICE
For a UL-approved system use 60/75°C copper conductors only.

CAUTION
Operating the equipment in the immediate vicinity (< 1.5 m) of mobile telephones with a transmitter power of > 1 W may lead to incorrect operation.

Residual risks of power drive systems

When carrying out a risk assessment of the machine/plant in accordance with the EU Machinery Directive, the machine manufacturer/plant operator must consider the following residual risks associated with the control and drive components of a power drive system (PDS).

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
 - Hardware defects and/or software errors in the sensors, controllers, actuators, and connection technology
 - Response times of the controller and drive
 - Operating and/or ambient conditions not within the scope of the specification
 - Parameterization, programming, cabling, and installation errors
 - Use of radio devices / cellular phones in the immediate vicinity of the controller
 - External influences / damage
2. Exceptional temperatures as well as emissions of light, noise, particles, or gas caused by, for example:
 - Component malfunctions
 - Software errors
 - Operating and/or ambient conditions not within the scope of the specification
 - External influences / damage
3. Hazardous shock voltages caused by, for example:
 - Component malfunctions
 - Influence of electrostatic charging
 - Induction of voltages in moving motors
 - Operating and/or ambient conditions not within the scope of the specification
 - Condensation / conductive contamination
 - External influences / damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close.
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly.

For more information about residual risks of the Power Drive System components, see the relevant chapters in the technical user documentation.

! WARNING**Electromagnetic fields "electro smog"**

Electromagnetic fields are generated by the operation of electrical power engineering installations such as transformers, converters or motors.

Electromagnetic fields can interfere with electronic devices, which could cause them to malfunction. For example, the operation of heart pacemakers can be impaired, potentially leading to damage to a person's health or even death. It is therefore forbidden for persons with heart pacemakers to enter these areas.

The plant operator is responsible for taking appropriate measures (labels and hazard warnings) to adequately protect operating personnel and others against any possible risk.

- Observe the relevant nationally applicable health and safety regulations. In Germany, "electromagnetic fields" are subject to regulations BGV B11 and BGR B11 stipulated by the German statutory industrial accident insurance institution.
- Display adequate hazard warning notices.

- Place barriers around hazardous areas.
- Take measures, e.g. using shields, to reduce electromagnetic fields at their source.
- Make sure that personnel are wearing the appropriate protective gear.

System overview

1.1 The SINAMICS range of drives

Field of application

SINAMICS is the family of drives from Siemens designed for machine and plant engineering applications. SINAMICS offers solutions for all drive tasks:

- Simple pump and fan applications in the process industry
- Complex single drives in centrifuges, presses, extruders, elevators, as well as conveyor and transport systems
- Drive line-ups in textile, plastic film, and paper machines, as well as in rolling mill plants
- High-precision servo drives for the manufacture of wind turbines
- Highly dynamic servo drives for machine tools, as well as packaging and printing machines.

Figure 1-1 SINAMICS applications

Variants

Depending on the application, the SINAMICS range offers the ideal variant for any drive task.

- SINAMICS G is designed for standard applications with induction motors. These applications have less stringent requirements regarding the dynamics and accuracy of the motor speed.
- SINAMICS S handles complex drive tasks with synchronous/induction motors and fulfills stringent requirements regarding
 - Dynamics and accuracy,
 - Integration of extensive technological functions in the drive control system.

Platform concept and Totally Integrated Automation

All SINAMICS versions are based on a platform concept. Common hardware and software components, as well as standardized tools for design, configuration and commissioning tasks, ensure high-level integration across all components. SINAMICS handles a wide variety of drive tasks without system gaps. The different SINAMICS versions can be easily combined with each other.

SINAMICS is part of the Siemens "Totally Integrated Automation" concept. Integrated SINAMICS systems covering engineering, data management and communication at the automation level, result in extremely cost-effective solutions based on SIMOTION, SINUMERIK and SIMATIC control systems.

Figure 1-2 SINAMICS as part of the Siemens modular automation system

Quality management according to DIN EN ISO 9001

SINAMICS is able to meet the highest requirements in terms of quality. Comprehensive quality assurance measures in all development and production processes ensure a consistently high level of quality.

Our quality assurance system is certified by an independent authority in accordance with DIN EN ISO 9001.

Universal applications

SINAMICS meets the requirements of relevant international standards and regulations - from the EN European standards through IEC to UL and cULus.

1.2 SINAMICS S120 drive system

Modular system for sophisticated drive tasks

SINAMICS S120 solves demanding drive tasks for a wide range of industrial applications and is, therefore, designed as a modular system. Users can choose from many different harmonized components and functions to create a solution that best meets their requirements. SIZER, a high-performance engineering tool, makes it easier to choose and determine the optimum drive configuration. SINAMICS S120 is enhanced by a wide range of motors. Whether synchronous or induction, all motor types are supported by SINAMICS S120.

Particularly suitable for multi-axis applications

Coordinated drives that carry out drive tasks together are used in many mechanical and plant engineering applications, including running gears in gantry cranes, stretching systems in the textile industry, or paper machines and rolling mills. These require drives with a connected DC link, which allows cost-saving energy balancing between braking and driving axes.

SINAMICS S120 features Line Modules (infeed modules) and Motor Modules (inverter modules) covering a wide power range which, having been designed for seamless integration, pave the way for compact multi-axis drive configurations.

Figure 1-3 SINAMICS S120 system overview

New system architecture with a central Control Unit

Electronically coordinated individual drives work together to perform your drive tasks. Higher-level controllers operate the drives to achieve the required coordinated movement. This requires cyclic data exchange between the control and all the drives. This exchange usually took place via a field bus, which required a great deal of time and effort for installation and configuration. SINAMICS S120 takes a different approach. A central Control Unit controls the drive for all connected axes and also establishes the technological links between the drives and/or axes. Since all the required data is stored in the central Control Unit, it does not need to be transferred. Inter-axis connections can be established within a Control Unit and easily configured in the STARTER commissioning tool using a mouse.

The SINAMICS S120 Control Unit solves basic technological tasks autonomously. For complex numerical or motion-control tasks, high-performance SIMOTION D modules are used instead.

DRIVE-CLiQ – the digital interface between all components

All SINAMICS S120 components, including the motors and encoders, are interconnected by a shared serial interface called DRIVE-CLiQ. The standardized cables and connectors reduce the variety of different parts and cut storage costs.

Converter boards (Sensor Modules) for converting standard encoder signals to DRIVE-CLiQ are available for third-party motors or retrofit applications.

Electronic rating plates in all components

All SINAMICS S120 components with a DRIVE-CLiQ interface have an electronic rating plate. This electronic rating plate contains all the relevant technical data about that particular component. For motors, for example, these data include the parameters of the electric equivalent circuit diagram and characteristic values for the built-in motor encoder. The Control Unit records these data automatically via DRIVE-CLiQ so that they do not need to be entered during commissioning or when the equipment is replaced.

In addition to the technical data, the rating plate includes logistical data (manufacturer ID, order number, and globally unique ID). Since these data can be called up electronically on site or remotely, all the components used in a machine can always be individually identified, which helps simplify servicing.

SINAMICS S120 components

The SINAMICS S120 components are primarily used for multi-axis drive tasks.

The following power components are available:

- **Line-side power components**, such as fuses, contactors, line reactors and line filters for switching the power supply and complying with EMC regulations.
- **Line Modules**, which supply power centrally to the DC link.
- **DC link components**, which are used optionally to stabilize the DC link voltage.
- **Motor Modules**, which act as inverters, receive power from the DC link, and supply the connected motors.
- **Motor-side components**, such as sine-wave filters, motor reactors, and dv/dt filters for reducing the voltage loads on the motor windings.

To carry out the required functions, SINAMICS S120 is equipped with:

- A **Control Unit** that carries out all drive and technological functions across all axes.
- **Additional system components** that enhance functionality and offer different interfaces for encoders and process signals.

SINAMICS S120 components were developed for installation in cabinets. They have the following features and characteristics:

- Easy to handle, simple installation and wiring
- Practical connection system, cable routing in accordance with EMC requirements
- Standardized design, seamless integration
- Internal air cooling (other cooling methods available on request).

1.3 Technical specifications

Technical data

Unless specified otherwise, the following technical data are valid for all the following components of the SINAMICS S120 drive system.

Table 1- 1 General technical data

Electrical data	
Line supply voltage	380 V 3 AC -10 % (-15 % < 1 min) to 480 V 3 AC +10 % 500 V 3 AC -10 % (-15 % < 1 min) to 690 V 3 AC +10 %
Line frequency	47 Hz to 63 Hz
Output voltage	0 to line connection voltage, depending on the type of infeed. With an Active Line Module, it is also possible to achieve a higher output voltage.
Output frequency	Vector control: 0 Hz to 600 Hz Servo control: 0 Hz to 650 Hz U/f control: 0 Hz to 650 Hz
Electronic power supply	24 V DC (20.4 V - 28.8 V) implemented as PELV circuit in accordance with EN 61800-5-1 Ground = Negative polarity grounded via the electronics
Rated short-circuit current SCCR (Short Circuit Current Rating) in accordance with UL508C (up to 600 V), in conjunction with the specified fuses or circuit breakers	1.1 kW – 447 kW: 65 kA 448 kW – 671 kW: 84 kA 672 kW – 1193 kW: 170 kA >1194 kW: 200 kA
DC link pre-charging frequency	Maximum of one precharge every 3 minutes
Interference suppression	
- Standard - With line filter	- Category C3 (environment 2) to EN 61800-3 - Category C2 (environment 1) to EN 61800-3
Overvoltage category	Class III according to EN 61800-5-1
Mechanical data	
Vibratory load - Transport ¹⁾ - Operation	- EN 60721-3-2, class 2M2 - Test values in accordance with EN 60068-2-6 test Fc: 10 to 58 Hz: constant deflection = 0.075 mm 58 to 150 Hz: constant acceleration = 9.81 m/s² (1 g)
Shock stressing - Transport ¹⁾ - Operation	- EN 60721-3-2, class 2M2 - Test values in accordance with EN 60068-2-27 test Ea: 98 m/s² (10 g) / 20 ms
Ambient conditions	
Degree of protection	IP00 or IP20 to EN 60529
Protection class	Class I (with protective conductor system) and class III (PELV) to EN 61800-5-1
Shock protection	EN 50274 and BGV A 3 when used as intended
Permissible ambient and coolant temperature (air) during operation for line-side components, Line Modules and Motor Modules	0 °C to +40 °C without derating, >40 °C to +55 °C (see derating characteristics)

1.3 Technical specifications

Permissible ambient and coolant temperature (air) during operation for DC link and motor-side power components	0 °C to +55 °C up to 2000 m above sea level
Cooling method according to EN 60146-1-1:1993	- Active Interface Modules, Basic Line Modules, Smart Line Modules, Active Line Modules, Motor Modules: AF - A: Air cooling - F: Forced cooling, drive unit inside the device - Line reactors, sine-wave filters, motor reactors, dv/dt filters with Voltage Peak Limiter: AN - A: Air cooling - N : Natural cooling (convection)
Climatic ambient conditions	
- Storage¹⁾ - Transport ¹⁾ - Operation	- Class 1K3 to EN 60721-3-1, Temperature: -40 °C to +70 °C - Class 2K4 to EN 60721-3-2, Temperature -40 °C to +70 °C Max. air humidity 95 % at +40 °C - Class 3K3 to EN 60721-3-3, Condensation, splashwater and ice formation are not permitted (EN 60204, Part 1)
Environmental class/harmful chemical substances	
- Storage¹⁾ - Transport ¹⁾ - Operation	- Class 1C2 according to EN 60721-3-1 - Class 2C2 according to EN 60721-3-2 - Class 3C2 according to EN 60721-3-3
Organic/biological influences	
- Storage¹⁾ - Transport ¹⁾ - Operation	- Class 1B1 according to EN 60721-3-1 - Class 2B1 according to EN 60721-3-2 - Class 3B1 according to EN 60721-3-3
Degree of pollution	2 to EN 61800-5-1 The devices may be operated only in environments with degree of pollution 2 and without condensation. On control cabinets with forced air cooling, foreign particles must be filtered out of the inflow air through filter mats. To prevent condensation, the devices can be warmed constantly by heaters.
The Safety Integrated safety function: The components must be protected against conductive contamination (e.g. by installing them in a cabinet with degree of protection IP54B to EN 60529). Provided that conducted interference can be prevented at the installation site, the degree of protection for the cabinet can be decreased accordingly.	
Installation altitude	≤ 2000 m above sea level without derating > 2000 ... 4000 m above sea level, see derating characteristics
Certificates	
Conformity	CE (Low Voltage and EMC Directives)
Standards	EN 61800-5-1, EN 60204-1, EN 61800-3, EN 60146-1-1
Approvals (only up to 600 V 3 AC)	cULus (File Nos.: E192450 and E214113)

¹⁾ In transport packaging

1.4 Derating factors as a function of installation altitude and ambient temperature

Chassis units and the associated system components are rated for an ambient temperature of 40 °C and installation altitudes up to 2000 m above sea level.

At ambient temperatures > 40 °C, the output current must be reduced. Ambient temperatures above 50 °C are not permissible.

At installation altitudes > 2000 m above sea level, it must be taken into account that the air pressure, and therefore the air density, decreases as the height increases. This reduces both the cooling effect as well as the insulating strength of the air.

As a result of the lower cooling effect, on the one hand, the ambient temperature must be reduced and, on the other hand, the power loss in the chassis unit must also be reduced by decreasing the output current; whereby ambient temperatures less than 40 °C can be factored in as countermeasure for compensation.

The following table shows the permissible output currents as a function of installation altitude and ambient temperature (the permissible compensation between installation altitude and ambient temperatures of < 40 °C – inlet air temperature at the air inlet of the chassis unit – is taken into account in the specified values).

The values apply under the precondition that a cooling air flow through the units as stated in the technical specifications is ensured.

As a further measure at installation altitudes of 2000 m and 5000 m, the use of an isolating transformer is required to reduce transient overvoltages in accordance with EN 60664-1.

Table 1- 2 Current derating for chassis units as a function of ambient temperature (air intake temperature at the air inlet of the chassis unit) and installation altitude

Installation altitude above sea level in m	Current derating factor (in % of rated current) at an ambient temperature (air intake temperature) of							
	20 °C	25 °C	30 °C	35 °C	40 °C	45 °C	50 °C	55 °C
0 ... 2000	100 %	100 %	100 %	100 %	100 %	93.3 %	86.7 %	80.0 %
... 2500	100 %	100 %	100 %	100 %	96.3 %

Figure 1-6 Basic structure of a drive system with SINAMICS S120 and unregulated infeed

Line-side power components

2.1 General

Line-side power components are used to protect the connected components against transient or continuous overvoltages and ensure that prescribed limit values are adhered to.

2.2 Line filters for Basic Line Modules

2.2.1 Description

In conjunction with line reactors and a systematic plant configuration, line filters limit the conducted interference emitted by the power modules at the installation location to permissible values for industry.

2.2.2 Safety information

CAUTION
--

Line filters are only suitable for direct connection to TN systems.

CAUTION

The cooling clearances of 100 mm above and below the components must be observed. This prevents thermal overloading of the filter.
--

CAUTION

The connections must not be interchanged:

- | |
|--|
| <ul style="list-style-type: none">• Incoming line cable to LINE/NETZ L1, L2, L3• Outgoing cable to the reactor to LOAD/LAST L1', L2', L3' |
|--|

Non-observance may damage the line filter.
--

CAUTION

The line filters listed conduct a high leakage current via the PE conductor. A permanent PE connection for the line filter or control cabinet is required due to the high leakage current of the line filters.
--

According to EN 61800-5-1, Section. 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.
--

Note

If a high-voltage test is conducted with alternating voltage, the line filter must be disconnected to obtain an accurate measurement result.
--

If a high-voltage test is carried out with direct voltage, the connection bracket for the interference-suppression capacitor in the Basic Line Module must also be removed, refer to section (Page 82) "Electrical connection".

CAUTION

Using line filters not approved by SIEMENS for SINAMICS can lead to line-side harmonics that can interfere with or damage other loads powered from the network.

2.3 Line reactors for Basic Line Modules

2.3.1 Description

Line reactors limit low-frequency line harmonics and reduce the load on the semiconductors in the Basic Line Modules. A line reactor must be used in connection with a line filter or if several Basic Line Modules are operated in parallel.

If a Basic Line Module is operated singly and no line filter is used, and with an effective line impedance $u_k > 3\%$, the line reactor is not necessary.

2.3.2 Safety information

CAUTION
The 100 mm cooling clearances above and to the side of the components must be observed.

Note

The connecting cables to the Line Module must be kept as short as possible (max. 5 m).

CAUTION
When using line reactors that have not been approved by SIEMENS for SINAMICS, the following can occur:
• The Basic Line Modules may become damaged/faulty. • Line harmonics may interfere with or damage other loads connected to the same line supply.

2.4 Line reactors for Smart Line Modules

2.4.1 Description

Line reactors limit low-frequency line harmonics and reduce the load on the semiconductors in the Smart Line Modules. For this reason, line reactors must always be provided when Smart Line Modules are used.

2.4.2 Safety information

CAUTION
The 100 mm cooling clearances above and to the side of the components must be observed.

Note

The connecting cables to the Line Module must be kept as short as possible (max. 5 m).

CAUTION
When using line reactors that have not been approved by SIEMENS for SINAMICS, the following can occur: • The Smart Line Modules may become damaged/faulty. • Line harmonics may interfere with or damage other loads connected to the same line supply.

2.5 Active Interface Modules

2.5.1 Description

Active Interface Modules are used in conjunction with the Active Line Modules in chassis format. The Active Interface Modules contain a Clean Power Filter with basic RI suppression, the pre-charging circuit for the Active Line Module, the line voltage sensing circuit and monitoring sensors.

The bypass contactor is an integral component in frame sizes FI and GI, which ensures a highly compact design. The bypass contactor must be provided separately for frame sizes HI and JI.

The vast majority of line harmonics are suppressed by the Clean Power Filter.

The Active Interface Module contains:

- Clean Power Filter
- Line reactor
- Pre-charging circuit
- Bypass contactor (frame sizes FI/GI)
- Voltage Sensing Module (VSM)
- Fan

Table 2- 14 Active Interface Module

			
Frame size FI	Frame size GI	Frame size HI	Frame size JI

2.5.2 Safety information

CAUTION
--

The DC link discharge time hazard warning must be affixed to the component in the relevant local language.
--

NOTICE

The cooling clearances above, below, and in front of the component, which are specified in the dimension drawings, must be observed.
--

DANGER

Active Interface Modules discharge a high leakage current to the protective ground conductor.

Due to the high leakage current associated with Active Interface Modules, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

	12	Bypass contactor–A2		To Active Line Module, X9:4	
	13	Contactor feedback 1 *	Voltage: 230 V AC (195.5 V – 264.5 V) Max. permissible current: 6 A		
	14	Contactor feedback 2 *			
Max. connectable cross-section 1.5 mm ²					

* Series connection NO contact of pre-charge contactor and bypass contactor (only for frame size FI, GI)

CAUTION

Active Interface Modules of frame sizes HI and JI require a signal on terminal X609:11 and 12 to control the fans. If this signal is not present during operation, the fans do not rotate and the module is shut down on overtemperature.

2.5.3.6 Meaning of the LED on the Voltage Sensing Module (VSM) in the Active Interface Module

Table 2- 18 Description of the LED on the Voltage Sensing Module (VSM) in the Active Interface Module

LED	Color	State	Description
RDY	---	Off	The electronics power supply is missing or out of tolerance
	Green	Continuously lit	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	Continuously lit	DRIVE-CLiQ communication is being established.
	Red	Continuously lit	At least one fault is present in this component. Note: LED is driven irrespective of the corresponding messages being reconfigured.
	Green / red	Flashing 0.5 Hz	Firmware is being downloaded.
		Flashing 2 Hz	Firmware download is complete. Waiting for POWER ON
	Green / orange or Red / orange	Flashing 2 Hz	Component recognition via LED is activated (p0144) Note: The two options depend on the LED status when module recognition is activated via p0144 = 1.

2.5.5 Electrical connection

The Active Interface Module is electrically connected in accordance with the connection examples shown in section "Interface description".

Operating an Active Interface Module on a grounded system/IT system

When the device is operated on a non-grounded system/IT system, the connection bracket to the noise suppression capacitor must be removed (e.g.: see "1" in figure below).

The interface overview in the section "Interface description" shows the installation position of the connection bracket on the different frame sizes.

With devices of frame sizes HI and JI, two connection brackets must be removed.

Figure 2-19 Removing the connection bracket to the noise suppression capacitor (example: frame size JI)

WARNING

Failing to remove the connection bracket for the noise suppression capacitor on a non-grounded system/IT system can cause significant damage to the unit.

Line Modules

3.1 Introduction

The drive line-up is connected to the power supply network via the Line Modules.

Line Infeeds generate a DC voltage from the connected line voltage that is used to power the connected Motor Modules.

The Line and Interface Modules are suitable for direct operation on TN, IT and TT systems.

General characteristics of the Line Modules

- Supply voltage:
 - 3-ph. 380 V AC -10% (-15% < 1 min) to 3-ph. 480 V AC +10%
 - 3-ph. 500 V AC -10% (-15% < 1 min) to 3-ph. 690 V AC +10%
- Line frequency: 47 to 63 Hz
- Suitable for TN, TT, and IT supply systems
- Operating status and error status via LEDs

3.2 Basic Line Modules

3.2.1 Description

Basic Line Modules are used for the power infeed into the DC link.

They are suitable for applications in which no regenerative energy is produced, or in which the energy exchange takes place between the motor- and the generator-driven axes in the DC link.

The DC link voltage is greater than the rms value of the line rated voltage by a factor of 1.35 (under partial load) or 1.32 (under full load).

Table 3- 1 Overview of Basic Line Modules

	
Frame size FB	Frame size GB

Components of the Basic infeed

A Basic Infeed comprises a Basic Line Module and an external line connection, which comprises a line filter and a line reactor.

Operating principle

One or more Motor Modules can be connected to the power supply network via the Basic Line Module. The Basic Line Module provides the DC link voltage for the Motor Modules.

The Basic Line Module is suitable for direct operation both on TN and on IT and TT systems.

Parallel connection of Basic Line Modules to increase power rating

Up to four Basic Line Modules with the same power rating can be connected in parallel in order to increase power.

The following rules must be observed when connecting Basic Line Modules in parallel:

- Up to 4 identical Basic Line Modules can be connected in parallel.
- A common Control Unit is required whenever the modules are connected in parallel.
- With multiple infeeds, power must be supplied to the systems from a common infeed point (i.e. different supply systems are not permitted).
- A line reactor must be series-connected to every parallel-connected Basic Line Module.
- A derating factor of 7.5 % must be taken into consideration, regardless of the number of modules connected in parallel.

Note

It is only possible to connect identical power units in parallel if both power units have the same hardware version. Mixed operation between a power unit with Control Interface Module (order number 6SL33xx-xxxxx-xAA3) and a power unit with Control Interface Board (order number 6SL33xx-xxxxx-xAA0) is not possible.

3.2.2 Safety information

WARNING

A hazardous voltage will be present in the component for a further 5 minutes after all voltage supplies have been disconnected. Work cannot be carried out until this time has elapsed.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

CAUTION

The DC link discharge time hazard warning must be affixed to the component in the relevant local language.

NOTICE

The cooling clearances above, below, and in front of the component, which are specified in the dimension drawings, must be observed.

DANGER

Basic Line Modules discharge a high leakage current to the protective ground conductor. Due to the high leakage current associated with Basic Line Modules, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

3.2.3.4 X9 terminal strip

Table 3- 3 Terminal strip X9

	Terminal	Signal name	Technical specifications
	1	P24V	Voltage: 24 V DC (20.4 V – 28.8 V) Power consumption: max. 1.1 A
	2	M	
	3	Reserved, do not use	
	4		
	5	Line contactor control	240 V AC: max. 8 A 30 V DC: max. 1 A isolated
	6		
Max. connectable cross-section 1.5 mm ²			

3.2.3.5 X41 EP terminal / temperature sensor connection

Table 3- 4 Terminal strip X41

	Terminal	Function	Technical specifications
	1	EP M1 (Enable Pulses)	Supply voltage: 24 V DC (20.4 V – 28.8 V)
	2	EP +24 V (Enable Pulses)	Power consumption: 10 mA
	3	- Temp	Temperature sensor connection KTY84-1C130/PTC
	4	+ Temp	
Max. connectable cross-section 1.5 mm ²			

Note

For operation, 24 V DC must be connected to terminal 2 and ground to terminal 1. Pulse suppression is activated when terminals are disconnected.

DANGER

Risk of electric shock!

Only temperature sensors that meet the safety isolation specifications contained in EN 61800-5-1 may be connected to terminals "+Temp" and "-Temp". If safe electrical separation cannot be guaranteed (for linear motors or third-party motors, for example), a Sensor Module External (SME120 or SME125) must be used.

If these instructions are not complied with, there is a risk of electric shock!

Note

The following probes can be connected to the temperature sensor connection: KTY84-1C130 / PTC.

CAUTION

The temperature sensor connection must be shielded. The shielding must be attached to the shield support of the module.

NOTICE

The KTY temperature sensor must be connected with the correct polarity.

3.2.3.6 X42 terminal strip

Table 3- 5 Terminal strip X42 voltage supply for Control Unit, Sensor Module and Terminal Module

	Terminal	Function	Technical specifications
	1	P24L	Voltage supply for Control Unit, Sensor Module and Terminal Module (18 to 28.8 V) maximum load current: 3 A
	2		
	3	M	
	4		
Max. connectable cross-section 2.5 mm²			

 CAUTION

The terminal block is not intended for free 24 V DC availability (for example for supplying further line-side components), as the voltage supply of the Control Interface Module could also be overloaded and operating capability could thus be compromised.

3.2.3.7 DRIVE-CLiQ interfaces X400, X401, X402

Table 3- 6 DRIVE-CLiQ interfaces X400, X401, X402

	B	M (0 V)	Electronics ground
Blanking plate for DRIVE-CLiQ interfaces (50 pcs.) order number: 6SL3066-4CA00-0AA0			

3.2.3.8 Meaning of the LEDs on the Control Interface Module in the Basic Line Module

Table 3- 7 Meaning of the LEDs "READY" and "DC LINK" on the Control Interface Module in the Basic Line Module

LED state		Description
READY	DC LINK	
Off	Off	The electronics power supply is missing or out of tolerance.
Green	Off	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is present.
	Red	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is too high.
Orange	Orange	DRIVE-CLiQ communication is being established.
Red	---	At least one fault is present in this component. Note: LED is driven irrespective of the corresponding messages being reconfigured.
Flashing light 0.5 Hz: Green / red	---	Firmware is being downloaded.
2 Hz flashing: Green / red	---	Firmware download is complete. Waiting for POWER ON.
2 Hz flashing: Green / orange or red / orange	---	Component detection using LED is activated (p0124) Note: The two options depend on the LED status when module recognition is activated via p0124 = 1.

Table 3- 8 Meaning of the LED "POWER OK" on the Control Interface Module in the Basic Line Module

LED	Color	Status	Description
POWER OK	Green	Off	DC link voltage < 100 V and voltage at -X9:1/2 less than 12 V.
		On	The component is ready for operation.
		Flashing light	There is a fault. If the LED continues to flash after you have performed a POWER ON, please contact your Siemens service center.

WARNING

Irrespective of the state of the LED "DC LINK", hazardous DC link voltages can always be present.

The warning information on the component must be carefully observed!

3.2.4 Dimension drawing

Dimension drawing, frame size FB

The mandatory cooling clearances are indicated by the dotted line.

Figure 3-4 Dimension drawing, Basic Line Module, frame sizes FB, side view, front view

Dimension drawing, frame size GB

The mandatory cooling clearances are indicated by the dotted line.

Figure 3-5 Dimension drawing, Basic Line Module, frame size GB Side view, rear view

3.2.5 Electrical connection

Operating a Basic Line Module from a non-grounded system (IT system)

When the device is operated on a non-grounded system/IT system, the connection bracket to the noise suppression capacitor must be removed (e.g.: see "1" in figure below).

The interface overview in the section "Interface description" shows the installation position of the connection bracket on the different frame sizes.

Figure 3-6 Removing the connection bracket to the noise suppression capacitor (example: frame size FB)

! WARNING

Failing to remove the connection bracket for the noise suppression capacitor on a non-grounded system/IT system can cause significant damage to the unit.

Adjusting the fan voltage (-T10)

The power supply for the device fans (1-ph. 230 V AC) in the Basic Line Module (-T10) is taken from the line supply using transformers. The installation position of the transformers is indicated in the interface descriptions.

The transformers are fitted with primary taps so that they can be fine-tuned to the line supply voltage.

If necessary, the connection fitted in the factory, shown with a dashed line, must be reconnected to the actual line voltage.

Figure 3-7 Setting terminals for the fan transformers (380 V – 480 V 3 AC / 500 V – 690 V 3 AC)

The supply voltage assignments for making the appropriate setting on the fan transformer are indicated in the following tables (factory presetting: 480 V/0 V or 690 V/0 V).

Note

With the 500 V – 690 V 3 AC fan transformer, a jumper is inserted between the "600 V" terminal and the "CON" terminal. The "600 V" and "CON" terminals are for internal use.

CAUTION

If the terminals are not reconnected to the actual line voltage:

- The required cooling level will not be provided (risk of overheating).
- The fan fuses may blow (overload).

Table 3- 9 Line voltage assignment for setting the fan transformer (380 V – 480 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
380 V $\pm$ 10 %	380 V
400 V $\pm$ 10 %	400 V
440 V $\pm$ 10 %	440 V
480 V $\pm$ 10 %	480 V

Table 3- 10 Line voltage assignment for setting the fan transformer (500 V – 690 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
500 V $\pm$ 10 %	500 V
525 V $\pm$ 10 %	525 V
575 V $\pm$ 10 %	575 V
600 V $\pm$ 10 %	600 V
660 V $\pm$ 10 %	660 V
690 V $\pm$ 10 %	690 V

Overload capability

The Basic Line Modules have an overload reserve.

The criterion for overload is that the Basic Line Module is operated with its base load current before and after the overload occurs (a load duration of 300 s is used as a basis here).

High overload

The base load current for a high overload I_{H_DC} is based on a duty cycle of 150 % for 60 s; the max. current I_{max_DC} can flow for 5 s.

Figure 3-8 High overload

3.3 Smart Line Modules

3.3.1 Description

Smart Line Modules are infeed/regenerative feedback units. Like the Basic Line Module, they supply energy to the connected Motor Modules, but unlike the Basic Line Module, they can feed back regenerative energy.

The infeed occurs over a diode jumper, while stable, line-commutated regenerative feedback takes place via IGBTs with 100 % continuous energy regeneration.

The DC link voltage is greater than the rms value of the line rated voltage by a factor of 1.32 (under partial load) or 1.30 (under full load).

Table 3- 15 Overview of Smart Line Modules

		
Frame size GX	Frame size HX	Frame size JX

Components of the Smart Infeed

A Smart Infeed comprises a Smart Line Module and an external line connection, which comprises bypass contactor, precharging input circuit, fuse, and line reactor.

Figure 3-9 Overview of Smart Infeed

Operating principle

One or more Motor Modules can be connected to the power supply network via the Smart Line Module. The Smart Line Module provides the DC link voltage for the Motor Modules. The regenerative feedback capability of the Smart Line Module can be deactivated by parameterization.

The Smart Line Module is suitable for direct operation both on TN and on IT and TT systems.

In generator mode, the Smart Line Module feeds regenerative energy into the supply network. An integrated Voltage Sensing Module 10 (VSM10) is used for sensing the line voltage for regenerative feedback.

The Smart Line Module is used for:

- Machines with medium dynamic requirements
- Infrequent braking cycles and high braking energy

Parallel connection of Smart Line Modules to increase power rating

Up to four Smart Line Modules with the same power rating can be connected in parallel in order to increase power.

The following rules must be observed when connecting Smart Line Modules in parallel:

- Up to 4 identical Smart Line Modules can be connected in parallel.
- A common Control Unit is required whenever the modules are connected in parallel.
- With multiple infeeds, power must be supplied to the systems from a common infeed point (i.e. different supply systems are not permitted).
- A line reactor must be series-connected to every parallel-connected Smart Line Module.
- A derating factor of 7.5 % must be taken into consideration, regardless of the number of modules connected in parallel.

Note

It is only possible to connect identical power units in parallel if both power units have the same hardware version. Mixed operation between a power unit with Control Interface Module (order number 6SL33xx-xxxxx-xAA3) and a power unit with Control Interface Board (order number 6SL33xx-xxxxx-xAA0) is not possible.

CAUTION

Circuit breaker wiring

The signal from the leading contact of the circuit breaker must be interconnected to the OFF2 signal from the Control Unit. In this way, the SINAMICS control is able to delete pulses from the Smart Line Modules in good time, before the circuit breaker is opened.

Otherwise, the SINAMICS control would react with an overvoltage or undervoltage error message when the circuit breaker is triggered.

3.3.2 Safety information

WARNING

A hazardous voltage will be present in the component for a further 5 minutes after all voltage supplies have been disconnected. Work cannot be carried out until this time has elapsed.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

CAUTION

The DC link discharge time hazard warning must be affixed to the component in the relevant local language.

NOTICE

The cooling clearances above, below, and in front of the component, which are specified in the dimension drawings, must be observed.

CAUTION

In a supply system without regenerative capability (e.g. diesel generator), the regenerative feedback capability of the Smart Line Module must be deactivated in the relevant parameter (see Description of Functions). The braking energy must then be dissipated via an additional Braking Module with a braking resistor in the drive line-up.

DANGER

Smart Line Modules discharge a high leakage current to the protective ground conductor. Due to the high leakage current associated with Smart Line Modules, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

Max. connectable cross-section: Terminals 1 - 8: 1.5 mm², Terminals L1 - L3: 16 mm²

3.3.3.5 X41 EP terminal / temperature sensor connection

Table 3- 18 Terminal strip X41

	Terminal	Function	Technical specifications
	1	EP M1 (Enable Pulses)	Supply voltage: 24 V DC (20.4 V – 28.8 V) Power consumption: 10 mA
	2	EP +24 V (Enable Pulses)	
	3	- Temp	Temperature sensor connection KTY84-1C130/PTC
	4	+ Temp	

Max. connectable cross-section 1.5 mm²

Note

For operation, 24 V DC must be connected to terminal 2 and ground to terminal 1. Pulse suppression is activated when terminals are disconnected.

! DANGER**Risk of electric shock!**

Only temperature sensors that meet the safety isolation specifications contained in EN 61800-5-1 may be connected to terminals "+Temp" and "-Temp". If safe electrical separation cannot be guaranteed (for linear motors or third-party motors, for example), a Sensor Module External (SME120 or SME125) must be used.

If these instructions are not complied with, there is a risk of electric shock!

Note

The following probes can be connected to the temperature sensor connection:
KTY84-1C130 / PTC.

CAUTION

The temperature sensor connection must be shielded. The shielding must be attached to the shield support of the module.

NOTICE

The KTY temperature sensor must be connected with the correct polarity.

3.3.3.6 X42 terminal strip

Table 3- 19 Terminal strip X42 voltage supply for Control Unit, Sensor Module and Terminal Module

	Terminal	Function	Technical specifications
	1	P24L	Voltage supply for Control Unit, Sensor Module and Terminal Module (18 to 28.8 V) maximum load current: 3 A
	2		
	3	M	
	4		
Max. connectable cross-section 2.5 mm²			

! CAUTION

The terminal block is not intended for free 24 V DC availability (for example for supplying further line-side components), as the voltage supply of the Control Interface Module could also be overloaded and operating capability could thus be compromised.

3.3.3.7 DRIVE-CLiQ interfaces X400, X401, X402

Table 3- 20 DRIVE-CLiQ interfaces X400, X401, X402

3.3.3.8 Meaning of the LEDs on the Control Interface Module in the Smart Line Module

Table 3- 21 Meaning of the LEDs "READY" and "DC LINK" on the Control Interface Module in the Smart Line Module

LED state		Description
READY	DC LINK	
Off	Off	The electronics power supply is missing or out of tolerance.
Green	Off	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is present.
	Red	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is too high.
Orange	Orange	DRIVE-CLiQ communication is being established.
Red	---	At least one fault is present in this component. Note: LED is driven irrespective of the corresponding messages being reconfigured.
Flashing light 0.5 Hz: Green / red	---	Firmware is being downloaded.
2 Hz flashing: Green / red	---	Firmware download is complete. Waiting for POWER ON.
2 Hz flashing: Green / orange or red / orange	---	Component detection using LED is activated (p0124) Note: The two options depend on the LED status when module recognition is activated via p0124 = 1.

Table 3- 22 Meaning of the LED "POWER OK" on the Control Interface Module in the Smart Line Module

LED	Color	Status	Description
POWER OK	Green	Off	DC link voltage < 100 V and voltage at -X9:1/2 less than 12 V.
		On	The component is ready for operation.
		Flashing light	There is a fault. If the LED continues to flash after you have performed a POWER ON, please contact your Siemens service center.

WARNING

Irrespective of the state of the LED "DC LINK", hazardous DC link voltages can always be present.

The warning information on the component must be carefully observed!

3.3.4 Dimension drawing

Dimension drawing, frame size GX

The mandatory cooling clearances are indicated by the dotted line.

Figure 3-14 Dimension drawing Smart Line Module, frame size GX Front view, side view

Dimension drawing, frame size HX

The mandatory cooling clearances are indicated by the dotted line.

Figure 3-15 Dimension drawing Smart Line Module, frame size HX Side view, rear view

Dimension drawing, frame size JX

The mandatory cooling clearances are indicated by the dotted line.

Figure 3-16 Dimension drawing Smart Line Module, frame size JX Side view, rear view

3.3.5 Electrical connection

Operating a Smart Line Module on a non-grounded system (IT system)

When the device is operated on a non-grounded system/IT system, the connection bracket to the noise suppression capacitor must be removed (e.g.: see "1" in figure below).

The interface overview in the section "Interface description" shows the installation position of the connection bracket on the different frame sizes.

With frame sizes HX and JX, you must remove the left-hand fan before removing the connection bracket (see "Replacing components").

Figure 3-17 Removing the connection bracket to the noise suppression capacitor (example: Frame size JX)

! WARNING

Failing to remove the connection bracket for the noise suppression capacitor on a non-grounded system/IT system can cause significant damage to the unit.

Adjusting the fan voltage (-T10)

The power supply for the device fans (1-ph. 230 V AC) in the Smart Line Module (-T10) is taken from the line supply using transformers. The installation position of the transformers is indicated in the interface descriptions.

The transformers are fitted with primary taps so that they can be fine-tuned to the line supply voltage.

If necessary, the connection fitted in the factory, shown with a dashed line, must be reconnected to the actual line voltage.

Note

Two transformers (-T10 and -T20) are installed in Smart Line Modules, frame size JX. The two primary-side terminals on each of these devices must be adjusted together.

Figure 3-18 Setting terminals for the fan transformers (380 V – 480 V 3 AC / 500 V – 690 V 3 AC)

The supply voltage assignments for making the appropriate setting on the fan transformer are indicated in the following tables (factory presetting: 480 V/0 V or 690 V/0 V).

Note

With the 500 V – 690 V 3 AC fan transformer, a jumper is inserted between the "600 V" terminal and the "CON" terminal. The "600 V" and "CON" terminals are for internal use.

CAUTION

If the terminals are not reconnected to the actual line voltage:

- The required cooling level will not be provided (risk of overheating).
- The fan fuses may blow (overload).

Table 3- 23 Line voltage assignment for setting the fan transformer (380 V – 480 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
380 V $\pm$ 10 %	380 V
400 V $\pm$ 10 %	400 V
440 V $\pm$ 10 %	440 V
480 V $\pm$ 10 %	480 V

Table 3- 24 Line voltage assignment for setting the fan transformer (500 V – 690 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
500 V $\pm$ 10 %	500 V
525 V $\pm$ 10 %	525 V
575 V $\pm$ 10 %	575 V
600 V $\pm$ 10 %	600 V
660 V $\pm$ 10 %	660 V
690 V $\pm$ 10 %	690 V

Overload capability

The Smart Line Modules have an overload reserve.

The criterion for overload is that the Smart Line Module is operated with its base load current before and after the overload occurs (a load duration of 300 s is used as a basis here).

High overload

The base load current for a high overload I_{H_DC} is based on a duty cycle of 150 % for 60 s; the max. current I_{max_DC} can flow for 5 s.

Figure 3-19 High overload

3.4 Active Line Modules

3.4.1 Description

The self-commutating infeed / regenerative feedback units act as step-up converters and generate a stabilized DC link voltage that is 1.5x greater than the rated line supply voltage. In this way, the connected Motor Modules are isolated from the line voltage. This improves the dynamic response and control quality because line tolerances and fluctuations do not affect the motor voltage.

If required, the Active Line Modules can also provide reactive power compensation.

Table 3- 28 Overview of Active Line Modules

			
Frame size FX	Frame size GX	Frame size HX	Frame size JX

Active Infeed components

An Active Infeed comprises an Active Interface Module and an Active Line Module.

The bypass contactor is fitted in the relevant Active Interface Module on Active Infeeds which feature an Active Line Module of frame size FX or GX. The Active Interface Modules and Active Line Modules of these frame sizes have degree of protection IP20.

Figure 3-20 Overview of Active Infeed (frame sizes FI/FX and GI/GX)

In the case of an Active Infeed with an Active Line Module of frame sizes HX or JX, the bypass contactor is not included in the associated Active Interface Module, but must be provided separately. The Active Interface Modules and Active Line Modules of these frame sizes have degree of protection IP00.

Figure 3-21 Overview of Active Infeed (frame sizes HI/HX and JI/JX)

Operating principle

One or more Motor Modules can be connected to the power supply network via the Active Line Module. The Active Line Module provides a constant DC link voltage for the Motor Modules. This ensures that they are not influenced by line voltage fluctuations. The regenerative feedback capability of the Active Line Module can be deactivated by parameterization.

The Active Line Module is suitable for direct operation both on TN and on IT and TT systems.

With the motors operating as generators, the Active Line Module feeds regenerative energy into the supply network.

The Active Line Module is used for:

- Machines with high dynamic drive requirements
- Frequent braking cycles and high braking energy

Parallel connection of Active Line Modules to increase power rating

Up to four Active Line Modules with the same power rating can be connected in parallel in order to increase power.

The following rules must be observed when connecting Active Line Modules in parallel:

- Up to 4 identical Active Line Modules can be connected in parallel.
- A common Control Unit is required whenever the modules are connected in parallel.
- With multiple infeeds, power must be supplied to the systems from a common infeed point (i.e. different supply systems are not permitted).
- A derating factor of 5% must be taken into consideration, regardless of the number of modules connected in parallel.

Note

It is only possible to connect identical power units in parallel if both power units have the same hardware version. Mixed operation between a power unit with Control Interface Module (order number 6SL33xx-xxxxx-xAA3) and a power unit with Control Interface Board (order number 6SL33xx-xxxxx-xAA0) is not possible.

3.4.2 Safety information

WARNING

A hazardous voltage will be present in the component for a further 5 minutes after all voltage supplies have been disconnected. Work cannot be carried out until this time has elapsed.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

CAUTION

The DC link discharge time hazard warning must be affixed to the component in the relevant local language.

NOTICE

The cooling clearances above, below, and in front of the component, which are specified in the dimension drawings, must be observed.

CAUTION

In a supply system without regenerative capability (e.g. diesel generator), the regenerative feedback capability of the Active Line Module must be deactivated in the relevant parameter (see Description of Functions). The braking energy must then be dissipated via an additional Braking Module with a braking resistor in the drive line-up.

DANGER

Active Line Modules discharge a high leakage current to the protective ground conductor. Due to the high leakage current associated with Active Line Modules, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

3.4.3.4 X9 terminal strip

Table 3- 30 Terminal strip X9

	Terminal	Signal name	Technical specifications
	1	P24V	Voltage: 24 V DC (20.4 V – 28.8 V)
	2	M	Power consumption: max. 1.7 A
	3	Bypass contactor control	for Active Interface Module, X609:11
	4		for Active Interface Module, X609:12
	5	Pre-charge contactor control	for Active Interface Module, X609:9
	6		for Active Interface Module, X609:10
	L1	Connection for fan supply (frame sizes HX and JX only)	380 V to 480 V AC / 500 V to 690 V AC Power consumption: See Technical data
	L2		

Max. connectable cross-section: Terminals 1 – 6: 1.5 mm², Terminals L1 - L2: 35 mm²

Note**Connecting fan supply, with frame sizes FX and GX**

The fan supply for frame sizes FX and GX is connected directly to fuse holders -F10 and -F11.

3.4.3.5 X41 EP terminal / temperature sensor connection

Table 3- 31 Terminal strip X41

	Terminal	Function	Technical specifications
	1	EP M1 (Enable Pulses)	Supply voltage: 24 V DC (20.4 V – 28.8 V)
	2	EP +24 V (Enable Pulses)	Power consumption: 10 mA
	3	- Temp	Temperature sensor connection KTY84-1C130 / PTC
	4	+ Temp	
Max. connectable cross-section 1.5 mm ²			

Note

For operation, 24 V DC must be connected to terminal 2 and ground to terminal 1. Pulse suppression is activated when terminals are disconnected.

DANGER

Risk of electric shock!

Only temperature sensors that meet the safety isolation specifications contained in EN 61800-5-1 may be connected to terminals "+Temp" and "-Temp". If safe electrical separation cannot be guaranteed (for linear motors or third-party motors, for example), a Sensor Module External (SME120 or SME125) must be used.

If these instructions are not complied with, there is a risk of electric shock!

Note

The following probes can be connected to the temperature sensor connection: KTY84-1C130 / PTC.

CAUTION

The temperature sensor connection must be shielded. The shielding must be attached to the shield support of the module.

NOTICE

The KTY temperature sensor must be connected with the correct polarity.

3.4.3.6 X42 terminal strip

Table 3- 32 Terminal strip X42 voltage supply for Control Unit, Sensor Module and Terminal Module

	Terminal	Function	Technical specifications
	1	P24L	Voltage supply for Control Unit, Sensor Module and Terminal Module (18 to 28.8 V) maximum load current: 3 A
	2		
	3	M	
	4		
Max. connectable cross-section 2.5 mm²			

 CAUTION

The terminal block is not intended for free 24 V DC availability (for example for supplying further line-side components), as the voltage supply of the Control Interface Module could also be overloaded and operating capability could thus be compromised.

3.4.3.7 DRIVE-CLiQ interfaces X400, X401, X402

3.4.3.8 Meaning of the LEDs on the Control Interface Module in the Active Line Module

Table 3- 34 Meaning of the LEDs "READY" and "DC LINK" on the Control Interface Module in the Active Line Module

LED state		Description
READY	DC LINK	
Off	Off	The electronics power supply is missing or out of tolerance.
Green	Off	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is present.
	Red	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is too high.
Orange	Orange	DRIVE-CLiQ communication is being established.
Red	---	At least one fault is present in this component. Note: LED is driven irrespective of the corresponding messages being reconfigured.
Flashing light 0.5 Hz: Green / red	---	Firmware is being downloaded.
2 Hz flashing: Green / red	---	Firmware download is complete. Waiting for POWER ON.
2 Hz flashing: Green / orange or red / orange	---	Component detection using LED is activated (p0124) Note: The two options depend on the LED status when module recognition is activated via p0124 = 1.

Table 3- 35 Meaning of the LED "POWER OK" on the Control Interface Module in the Active Line Module

LED	Color	Status	Description
POWER OK	Green	Off	DC link voltage < 100 V and voltage at -X9:1/2 less than 12 V.
		On	The component is ready for operation.
		Flashing light	There is a fault. If the LED continues to flash after you have performed a POWER ON, please contact your Siemens service center.

WARNING

Irrespective of the state of the LED "DC LINK", hazardous DC link voltages can always be present.

The warning information on the component must be carefully observed!

Figure 3-30 Dimension drawing Active Line Module, frame size JX Side view, rear view

3.4.5 Electrical connection

Adjusting the fan voltage (-T10)

The power supply for the device fans (1-ph. 230 V AC) in the Active Line Module (-T10) is taken from the line supply using transformers. The locations of the transformers are indicated in the interface descriptions.

The transformers are fitted with primary taps so that they can be fine-tuned to the line supply voltage.

If necessary, the connection fitted in the factory, shown with a dashed line, must be reconnected to the actual line voltage.

Note

Two transformers (-T10 and -T20) are installed in Active Line Modules, frame size JX. The two primary-side terminals on each of these devices must be adjusted together.

Figure 3-31 Setting terminals for the fan transformers
(380 V – 480 V 3 AC / 500 V – 690 V 3 AC)

The supply voltage assignments for making the appropriate setting on the fan transformer are indicated in the following tables (factory presetting: 480 V/0 V or 690 V/0 V).

Note

With the 500 V – 690 V 3 AC fan transformer, a jumper is inserted between the "600 V" terminal and the "CON" terminal. The "600V" and "CON" terminals are reserved for internal use.

CAUTION

If the terminals are not reconnected to the actual line voltage:

- The required cooling level will not be provided (risk of overheating).
- The fan fuses may blow (overload).

Table 3- 36 Line voltage assignments for setting the fan transformer
(380 to 480 V AC, 3-phase)

Line voltage	Tap at the fan transformer (-T10)
380 V $\pm$ 10 %	380 V
400 V $\pm$ 10 %	400 V
440 V $\pm$ 10 %	440 V
480 V $\pm$ 10 %	480 V

Table 3- 37 Line voltage assignments for setting the fan transformer
(500 V – 690 V AC, 3-phase)

Overload capability

The Active Line Modules have an overload reserve.

The criterion for overload is that the Active Line Module is operated with its base load current before and after the overload occurs (a load duration of 300 s is used as a basis here).

High overload

The base load current for a high overload I_{H_DC} is based on a duty cycle of 150 % for 60 s; the max. current I_{max_DC} can flow for 5 s.

Figure 3-32 High overload

Motor Modules

4.1 Description

A Motor Module is a power unit (DC-AC inverter) that provides the power supply for the motor connected to it. Power is supplied by means of the DC link of the drive unit.

A Motor Module must be connected to a Control Unit via DRIVE-CLiQ. The open-loop and closed-loop control functions are stored in the Control Unit.

Table 4- 1 Overview of Motor Modules

			
Frame size FX	Frame size GX	Frame size HX	Frame size JX

Operating principle

Motor Modules are designed for multi-axis drive systems and are controlled by either a CU320 or a SIMOTION D Control Unit. Motor Modules are interconnected by means of a shared DC busbar.

One or more Motor Modules are supplied with energy for the motors via the DC link. Both synchronous and induction motors can be operated.

Since the Motor Modules share the same DC link, they can exchange energy with one another, i.e. if one Motor Module operating in generator mode produces energy, the energy can be used by another Motor Module operating in motor mode. The DC link is supplied with line voltage by a Line Module.

Characteristics of the Motor Modules

- Version for 510 V DC to 750 V DC from 210 A to 1405 A
Version for 675 V DC to 1080 V DC from 85 A to 1270 A
- Internal air cooling
- Short-circuit/ground-fault-proof
- Electronic rating plate
- Operating status and error status via LEDs
- DRIVE-CLiQ interface for communication with the Control Unit and/or other components in the drive line-up.
- Integration in system diagnostics

4.2 Safety information

WARNING

After disconnecting all the supply voltages, a hazardous voltage will be present in all components for another 5 minutes. Work cannot be carried out until this time has elapsed.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

CAUTION

The DC link discharge time hazard warning must be affixed to the component in the relevant local language.

NOTICE

The cooling clearances above, below, and in front of the component, which are specified in the dimension drawings, must be observed.

WARNING

Cable shields and power cable conductors which are not used, must be connected to PE potential in order to discharge charges as a result of capacitive coupling.

Non-observance can cause lethal shock voltages.

DANGER

Motor Modules discharge a high leakage current to the protective ground conductor. Due to the high leakage current associated with Motor Modules, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

DCPS, DCNS connection for a dv/dt filter plus VPL	Voltage: • 510 to 750 V DC • 675 to 1080 V DC Connections: • Frame sizes FX / GX: M8 thread / 13 Nm for cable lugs in accordance with DIN 46234 / DIN 46235 • Frame sizes HX / JX: Thread M10 / 25 Nm for cable lugs in accordance with DIN 46234 / DIN 46235
U2, V2, W2 3 AC power output	Voltage: • 0 V 3 AC to 0.72 x DC link voltage Connecting thread: • Frame sizes FX / GX: M10 / 25 Nm for cable lugs in accordance with DIN 46234 / DIN 46235 • Frame sizes HX / JX: M12 / 50 Nm for cable lugs in accordance with DIN 46234 / DIN 46235
PE connection PE1, PE2	Connecting thread: • Frame sizes FX / GX: M10 / 25 Nm for cable lugs in accordance with DIN 46234 / DIN 46235 • Frame sizes HX / JX: M12 / 50 Nm for cable lugs in accordance with DIN 46234 / DIN 46235

4.3 Interface description

4.3.4 X9 terminal strip

Table 4- 3 Terminal strip X9

	Terminal	Signal name	Technical specifications
	1	P24V	Voltage: 24 V DC (20.4 V – 28.8 V) Power consumption: max. 1.4 A
	2	M	
	3	VL1	240 V AC: 8 A max.
	4	VL2	24 V DC: max. 1 A isolated
	5	HS1	240 V AC: 8 A max.
	6	HS2	24 V DC: max. 1 A isolated
	L1	Connection for fan supply (frame sizes HX and JX only)	380 V to 480 V AC / 500 V to 690 V AC Power consumption: See Technical data
	L2		
Max. connectable cross-section: Terminals 1 – 6: 1.5 mm ² , Terminals L1 - L2: 35 mm ²			

Note**Connecting fan supply, with frame sizes FX and GX**

The fan supply for frame sizes FX and GX is connected directly to fuse holders -F10 and -F11.

4.3.5 DCPS, DCNS connection for a dv/dt filter

Table 4- 4 DCPS, DCNS

Frame size	Connectable cross-section	Terminal screw
FX	1 x 35 mm ²	M8
GX	1 x 70 mm ²	M8
HX	1 x 185 mm ²	M10
JX	2 x 185 mm ²	M10

With frame sizes FX and GX, the connecting cables are routed down through the Motor Module and out.

4.3.6 X41 EP terminal / temperature sensor connection

Table 4- 5 Terminal strip X41

	Terminal	Function	Technical specifications
	1	EP M1 (Enable Pulses)	Supply voltage: 24 V DC (20.4 V – 28.8 V) Power consumption: 10 mA Signal propagation delay times: L → H 100 µs H → L: 1000 µs The pulse inhibit function is only available when Safety Integrated Basic Functions are enabled.
	2	EP +24 V (Enable Pulses)	
	3	- Temp	Temperature sensor connection KTY84-1C130/PTC / PT100
	4	+ Temp	
Max. connectable cross-section 1.5 mm ²			

DANGER

Risk of electric shock!

Only temperature sensors that meet the safety isolation specifications contained in EN 61800-5-1 may be connected to terminals "+Temp" and "-Temp". If safe electrical separation cannot be guaranteed (for linear motors or third-party motors, for example), a Sensor Module External (SME120 or SME125) must be used.

If these instructions are not complied with, there is a risk of electric shock!

Note

The following probes can be connected to the temperature sensor connection:
KTY84-1C130 / PTC / PT100.

CAUTION

The temperature sensor connection must be shielded. The shielding must be attached to the shield support of the motor module.

NOTICE

The KTY temperature sensor must be connected with the correct polarity.

NOTICE

The function of the EP terminals is only available when Safety Integrated Basic Functions are enabled.

4.3.7 X42 terminal strip

Table 4- 6 Terminal strip X42 voltage supply for Control Unit, Sensor Module and Terminal Module

	Terminal	Function	Technical specifications
	1	P24L	Voltage supply for Control Unit, Sensor Module and Terminal Module (18 to 28.8 V) maximum load current: 3 A
	2		
	3	M	
	4		
Max. connectable cross-section 2.5 mm²			

CAUTION

The terminal block is not intended for free 24 V DC availability (for example for supplying further line-side components), as the voltage supply of the Control Interface Module could also be overloaded and operating capability could thus be compromised.

4.3.8 X46 Brake control and monitoring

Table 4- 7 Terminal strip X46 brake control and monitoring

	Terminal	Function	Technical specifications
	1	BR output +	The interface is intended for connection of the Safe Brake Adapter.
	2	BR output -	
	3	FB input +	
	4	FB input -	
Max. connectable cross-section 1.5 mm ²			

CAUTION

The length of the connecting lead at terminal strip X46 must not exceed 10 m, and the lead must not be brought out outside the control cabinet or control cabinet group.

4.3.9 DRIVE-CLiQ interfaces X400, X401, X402

Table 4- 8 DRIVE-CLiQ interfaces X400, X401, X402

	PIN	Signal name	Technical specifications
	1	TXP	Transmit data +
	2	TXN	Transmit data -
	3	RXP	Receive data +
	4	Reserved, do not use	
	5	Reserved, do not use	
	6	RXN	Receive data -
	7	Reserved, do not use	
	8	Reserved, do not use	
	A	+ (24 V)	24 V power supply
	B	M (0 V)	Electronics ground
Blanking plate for DRIVE-CLiQ interfaces (50 pcs.) order number: 6SL3066-4CA00-0AA0			

4.3.10 Meaning of the LEDs on the Control Interface Module in the Motor Module

Table 4- 9 Meaning of the LEDs "READY" and "DC LINK" on the Control Interface Module in the Motor Module

LED state		Description
READY	DC LINK	
Off	Off	The electronics power supply is missing or out of tolerance.
Green	Off	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is present.
	Red	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place. The DC link voltage is too high.
Orange	Orange	DRIVE-CLiQ communication is being established.
Red	---	At least one fault is present in this component. Note: LED is driven irrespective of the corresponding messages being reconfigured.
Flashing light 0.5 Hz: Green / red	---	Firmware is being downloaded.
2 Hz flashing: Green / red	---	Firmware download is complete. Waiting for POWER ON.
2 Hz flashing: Green / orange or red / orange	---	Component detection using LED is activated (p0124) Note: The two options depend on the LED status when module recognition is activated via p0124 = 1.

Table 4- 10 Meaning of the LED "POWER OK" on the Control Interface Module in the Motor Module

LED	Color	Status	Description
POWER OK	Green	Off	DC link voltage < 100 V and voltage at -X9:1/2 less than 12 V.
		On	The component is ready for operation.
		Flashing light	There is a fault. If the LED continues to flash after you have performed a POWER ON, please contact your Siemens service center.

WARNING

Irrespective of the state of the LED "DC LINK", hazardous DC link voltages can always be present.

The warning information on the component must be carefully observed!

4.4 Dimension drawing

Dimension drawing, frame size FX

The mandatory cooling clearances are indicated by the dotted line.

Figure 4-6 Dimension drawing Motor Module, frame size FX Front view, side view

Dimension drawing, frame size GX

The mandatory cooling clearances are indicated by the dotted line.

Figure 4-7 Dimension drawing Motor Module, frame size GX Front view, side view

Dimension drawing, frame size HX

The mandatory cooling clearances are indicated by the dotted line.

Figure 4-8 Dimension drawing Motor Module, frame size HX Side view, rear view

Dimension drawing, frame size JX

The mandatory cooling clearances are indicated by the dotted line.

Figure 4-9 Dimension drawing Motor Module, frame size JX Side view, rear view

4.5 Electrical connection

Adjusting the fan voltage (-T10)

The power supply for the device fans (1-ph. 230 V AC) in the Motor Module (-T10) is taken from the line supply using transformers. The installation position of the transformers is indicated in the interface descriptions.

The transformers are fitted with primary taps so that they can be fine-tuned to the line supply voltage.

If necessary, the connection fitted in the factory, shown with a dashed line, must be reconnected to the actual line voltage.

Note

Two transformers (T10 and -T20) are installed in Motor Modules frame size JX. The two primary-side terminals on each of these devices must be adjusted together.

Figure 4-10 Setting terminals for the fan transformers (380 V – 480 V 3 AC / 500 V – 690 V 3 AC)

The supply voltage assignments for making the appropriate setting on the fan transformer are indicated in the following tables (factory presetting: 480 V/0 V or 690 V/0 V).

Note

With the 500 V – 690 V 3 AC fan transformer, a jumper is inserted between the "600 V" terminal and the "CON" terminal. The "600V" and "CON" terminals are reserved for internal use.

CAUTION

If the terminals are not reconnected to the actual line voltage:

- The required cooling level will not be provided (risk of overheating).
- The fan fuses may blow (overload).

Table 4- 11 Line voltage assignment for setting the fan transformer (380 V – 480 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
380 V $\pm$ 10 %	380 V
400 V $\pm$ 10 %	400 V
440 V $\pm$ 10 %	440 V
480 V $\pm$ 10 %	480 V

Table 4- 12 Line voltage assignment for setting the fan transformer (500 V – 690 V 3 AC)

Line voltage	Tap at the fan transformer (-T10)
500 V $\pm$ 10 %	500 V
525 V $\pm$ 10 %	525 V
575 V $\pm$ 10 %	575 V
600 V $\pm$ 10 %	600 V
660 V $\pm$ 10 %	660 V
690 V $\pm$ 10 %	690 V

¹⁾ Rated output of a typical 6-pole standard induction motor based on I _L or I _H at 500 V or 690 V 3 AC 50 Hz. ²⁾ Rated output of a typical 6-pole standard induction motor based on I _L or I _H at 575 V 3 AC 60 Hz. ³⁾ The specified power loss is the maximum value at 100% capacity utilization. The value in normal operation is lower.					

4.6.3 Overload capability

The Motor Modules have an overload reserve e.g. to handle breakaway torques.

In the case of drives with overload requirements, the appropriate base-load current must, therefore, be used as a basis for the required load.

The criterion for overload is that the Motor Module is operated with its base load current before and after the overload occurs (a load duration of 300 s is used as a basis here).

Low overload

The base load current for low overload (I_L) is based on a load duty cycle of 110 % for 60 s or 150 % for 10 s.

Figure 4-11 Low overload

High overload

The base load current for a high overload I_H is based on a duty cycle of 150 % for 60 s or 160 % for 10 s.

Figure 4-12 High overload

4.6.4 Current de-rating depending on the pulse frequency

When the pulse frequency is increased, the derating factor of the output current must be taken into account. This derating factor must be applied to the currents specified in the technical data for Motor Modules.

Table 4- 20 Derating factor of the output current as a function of the pulse frequency for devices with a rated pulse frequency of 2 kHz

Order no. 6SL3320-...	Unit rating [kW]	Output current for a pulse frequency of 2 kHz [A]	Derating factor for a pulse frequency of 4 kHz
Supply voltage 510 – 750 V DC			
1TE32-1AAx	110	210	82 %
1TE32-6AAx	132	260	83 %
1TE33-1AAx	160	310	88 %
1TE33-8AAx	200	380	87 %
1TE35-0AAx	250	490	78 %

Table 4- 21 Derating factor of the output current as a function of the pulse frequency for devices with a rated pulse frequency of 1.25 kHz

Order no. 6SL3320-...	Unit rating [kW]	Output current for a pulse frequency of 1.25 kHz [A]	Derating factor for a pulse frequency of 2.5 kHz
Supply voltage 510 – 750 V DC			
1TE36-1AAx	315	605	72 %
1TE37-5AAx	400	745	72 %
1TE38-4AAx	450	840	79 %
1TE41-0AAx	560	985	87 %
1TE41-2AAx	710	1260	87 %
1TE41-4AAx	800	1405	95 %
Supply voltage 675 – 1080 V DC			
1TG28-5AAx	75	85	89 %
1TG31-0AAx	90	100	88 %
1TG31-2AAx	110	120	88 %
1TG31-5AAx	132	150	84 %
1TG31-8AAx	160	175	87 %
1TG32-2AAx	200	215	87 %
1TG32-6AAx	250	260	88 %
1TG33-3AAx	315	330	82 %
1TG34-1AAx	400	410	82 %
1TG34-7AAx	450	465	87 %
1TG35-8AAx	560	575	85 %
1TG37-4AAx	710	735	79 %
1TG38-1AAx	800	810	95 %
1TG38-8AAx	900	910	87 %
1TG41-0AAx	1000	1025	86 %
1TG41-3AAx	1200	1270	79 %

Note

For pulse frequencies in the range between the specified fixed values, the relevant derating factors can be determined by linear interpolation.

Maximum output frequencies achieved by increasing the pulse frequency

By multiplying the rated pulse frequency with a multiple integer, the following output frequencies can be achieved taking into account the derating factors:

Table 4- 22 Maximum output frequencies achieved by increasing the pulse frequency in VECTOR mode.

Pulse frequency [kHz]	Maximum output frequency [Hz]
1.25	100
2	160
2.5	200
4	320
5	400

Table 4- 23 Maximum output frequencies achieved by increasing the pulse frequency in SERVO mode.

Pulse frequency [kHz]	Maximum output frequency [Hz]
2	300
4	300 / 650 ¹⁾

¹⁾ The maximum output frequency of 650 Hz is can only be achieved for a current controller clock cycle of 125 µs (factory setting: 250 µs).

4.6.5 Parallel connection of Motor Modules

The following rules must be observed when connecting Motor Modules in parallel:

- Up to 4 identical Motor Modules can be connected in parallel.
- A common Control Unit is required whenever the modules are connected in parallel.
- The motor supply cables must be the same length (symmetrical design).
- Power must be supplied to the Motor Modules from a common DC link.
- For motors with a single winding system, supply cables with a minimum length or motor reactors must be used. The cable lengths are listed in the following tables.
- A derating factor of 5 % must be taken into consideration, regardless of the number of modules connected in parallel.

Note

It is only possible to connect identical power units in parallel if both power units have the same hardware version. Mixed operation between a power unit with Control Interface Module (order number 6SL33xx-xxxxx-xAA3) and a power unit with Control Interface Board (order number 6SL33xx-xxxxx-xAA0) is not possible.

Minimum cable lengths for parallel connection and connection to a motor with a single-winding system

NOTICE

The minimum cable lengths specified in the tables below must be observed when two or more Motor Modules are connected in parallel and there is a connection to a motor with a single-winding system. If the cable length required for the application cannot be achieved, a motor reactor must be provided.

Table 4- 24 510 to 750 V DC Motor Modules

DC link components

5.1 Braking Module

5.1.1 Description

A Braking Module and an external braking resistor are required to bring drives to a controlled standstill in the event of a power failure (e.g. emergency retraction or EMERGENCY STOP category 1) or limit the DC link voltage if the generator is operated for a short period of time, for example because there is no regenerative feedback capability into the supply network when a Basic Line Module is used). The Braking Module contains the power electronics and the associated control.

During operation the DC link energy is converted into heat loss in an external braking resistor outside of the control cabinet. Braking Modules function autonomously. Parallel operation of several braking modules is possible. In this case, each Braking Module must have its own braking resistor.

Up to three slots are available depending on the size of the Basic Line Module, Smart Line Module, Active Line Module, or Motor Module:

Frame sizes FB, GB, FX, GX:	1 mounting location
Frame size HX:	2 mounting locations
Frame size JX:	3 mounting locations

Figure 5-1 Braking Module

Layout

The Braking Module in chassis format is inserted in a mounting location inside the Basic Line Modules, Smart Line Modules, Active Line Modules, or Motor Modules, the fan of which ensures forced cooling. The supply voltage for the electronics is drawn from the DC link. The Braking Module is connected to the DC link by means of the busbar sets and flexible cables, which are supplied as standard.

The activation threshold of the Braking Module can be adjusted by means of a DIP switch. The braking power values specified in the technical specifications apply to the upper activation threshold.

The Braking Module has as standard, the following interfaces:

- The DC link is connected through busbars and flexible cables
- Connecting terminal for external braking resistor
- 1 digital input (inhibit Braking Module with high signal / acknowledge error with negative edge high-low)
- 1 digital output (Braking Module inhibited)
- 1 DIP switch for adjusting the activation threshold

Note

To install a frame size GX Braking Module in a frame size GB Basic Line Module a cable harness set is required, which is available under order number 6SL3366-2NG00-0AA0.

5.1.2 Safety information

WARNING

After disconnecting all the supply voltages, a hazardous voltage will be present in all components for another 5 minutes. Work may not be carried out on the components until after this time has elapsed.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

CAUTION

The DC link discharge voltage hazard warning must be affixed to the modules in the local language.

CAUTION

The cables for the braking resistor must be routed to prevent short-circuiting and ground faults in accordance with IEC 61800-5-2:2007, Table D.1.

This can be accomplished, for example, by:

- Eliminating the risk of mechanical damage to the cables
- Using cables with double insulation
- Maintaining adequate clearance, using spacers, for example
- Laying the cables in separate cable ducts or pipes

Note

If braking resistors are used that have not been released by SIEMENS for SINAMICS, then the braking resistors could be destroyed.

5.1.3 Interface description

5.1.3.1 Braking Module for frame sizes FX, FB

Figure 5-2 Braking Module for Active Line Module / Motor Module, frame size FX and for Basic Line Module, frame size FB

Note

With this Braking Module, the R1 and DCPA interfaces use the same connection.

5.1.3.2 Braking Module for frame sizes GX, GB

Figure 5-3 Braking Module for Smart Line Module / Active Line Module / Motor Module, frame size GX and for Basic Line Module, frame size GB

Note

With this Braking Module, the R1 and DCPA interfaces use the same connection.

5.1.3.3 Braking Module for frame sizes HX, JX

Figure 5-4 Braking Module for Smart Line Module / Active Line Module / Motor Module, frame sizes HX / JX

5.1.3.4 Connection example

Figure 5-5 Connection example for Braking Module

5.1.3.5 Braking resistor connection

Table 5- 1 Braking resistor connection

Terminal	Designation
R1	Braking resistor connection R+
R2	Braking resistor connection R-
Recommended conductor cross-sections: for 25/125 kW: 35 mm ² , for 50/250 kW: 50 mm ²	

5.1.3.6 X21 digital inputs/outputs

Table 5- 2 X21 terminal strip

	Terminal	Designation ¹⁾	Technical specifications
	1	Shield	Shield connection for terminals 2 ... 6
	2	0 V	High signal level: +15 V to 30 V Current consumption: 2 mA to 15 mA Low signal level: -3 V to 5 V
	3	DI inhibit input	
	4	0 V	High signal: No fault Low signal: Fault present Voltage: 24 V DC Load current: 0.5 mA to 0.6 mA
	5	DO fault output	
	6	+24 V	Voltage: +18 V to 30 V Typical current consumption: 10 mA at 24 V DC
Max. connectable cross-section 1.5 mm ²			

¹⁾ DI: digital input; DO: Digital output

Note

The positions of the individual terminals of terminal strip X21 on the Braking Module are as follows when the module is installed: Terminal "1" is at the back, terminal "6" is at the front

Note

Applying a high signal to terminal X21.3 inhibits the Braking Module. On a falling edge, pending error signals are acknowledged.

Note

You will find setting instructions for wiring the signals in the SINAMICS S120 Function Manual.

5.1.3.7 S1 Threshold switch

The response threshold at which the Braking Module is activated and the DC link voltage generated during braking are specified in the following table.

**WARNING**

The threshold switch must only be used when the Basic Line, Smart Line, Active Line, or Motor Module are switched off and the DC link capacitors are discharged.

Table 5- 3 Response thresholds of the Braking Modules

Voltage	Response threshold	Switch position	Remark
380 V - 480 V 3 AC	673 V	1	774 V is the default factory setting. With supply voltages of between 380 V and 400 V 3 AC, the response threshold can be set to 673 V to reduce the voltage stress on the motor and converter. This does, however, reduce the possible braking power with the square of the voltage $(673/774)^2 = 0.75$. The maximum possible braking power is, therefore, 75 %.
	774 V	2	
500 V - 600 V 3 AC	841 V	1	967 V is the default factory setting. With a supply voltage of 500 V 3 AC, the response threshold can be set to 841 V to reduce the voltage stress on the motor and converter. This does, however, reduce the possible braking power with the square of the voltage $(841/967)^2 = 0.75$. The maximum possible braking power is, therefore, 75 %.
	967 V	2	
660 V - 690 V 3 AC	1070 V	1	1158 V is the default factory setting. With a supply voltage of 660 V 3 AC, the response threshold can be set to 1070 V to reduce the voltage stress on the motor and converter. This does, however, reduce the possible braking power with the square of the voltage $(1070/1158)^2 = 0.85$. The maximum possible braking power is, therefore, 85 %.
	1158 V	2	

Note

The switch positions of the threshold switches of the Braking Modules are positioned on the panel as follows:

- Braking Modules for frame sizes FX, FB, GX, GB: Position "1" is at the top; position "2" is at the bottom
- Braking Modules for frame sizes HX and JX: Position "1" is at the back; position "2" is at the front

CAUTION

Even when the response threshold is set to a low value, the DC link voltage can still reach the maximum voltage value (hardware shutdown threshold), thus triggering the "Overvoltage" fault. This can occur, for example, in cases where there is too much regenerative energy for the available braking power.

To prevent the DC link voltage from exceeding the threshold, the Vdc-max controller must be enabled (p1240) and the device supply voltage set accordingly (p0210).

5.1.4 Installation

5.1.4.1 Installing the Braking Module in an Active Line Module / Motor Module, frame size FX

Figure 5-6 Installing the Braking Module in an Active Line Module / Motor Module, frame size FX – steps 1 - 3

Figure 5-7 Installing the Braking Module in an Active Line Module / Motor Module, frame size FX – steps 4 - 6

Installing the Braking Module

The steps for the installation procedure are numbered in accordance with the diagrams in front of them.

1. Unscrew the 2 M6 screws from the front cover and lift off the cover.
2. Unscrew the 2 screws from the upper cover plate.
Loosen the 1 M6 nut on the left
Remove the left cover
3. Unscrew the 4 screws from the upper cover plate.
Unscrew the 3 screws from the rear cut-out sections
Remove the top covers.

5.1 Braking Module

4. Unscrew the 3 screws for the blanking plate.

Remove the plate.

5. Insert the Braking Module where the cover used to be and secure it using the 3 screws (from step 4).
6. Secure the connecting cable to the DC link with 2 screws (Braking Module connection) and 2 nuts (DC link connection).

Carry out the subsequent steps in reverse order from steps 1 – 3.

An opening above the connections for the braking resistor (R1, R2) is provided in the cover for connecting the cable to the braking resistor.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.1.4.2 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size GX

Figure 5-8 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size GX – steps 1 - 3

Figure 5-9 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size GX – steps 4 - 6

Installing the Braking Module

The steps for the installation procedure are numbered in accordance with the diagrams in front of them.

1. Unscrew the 2 M6 screws from the front cover and lift off the cover.
2. Unscrew the 2 screws from the upper cover plate.
Loosen the 1 M6 nut on the left.
Remove the left cover
3. Unscrew the 4 screws from the upper cover plate.
Unscrew the 3 screws from the rear cut-out sections.
Remove the top covers.

4. Unscrew the 3 screws for the blanking plate.

Remove the plate.

5. Insert the Braking Module where the cover used to be and secure it using the 3 screws (from step 4).
6. Secure the connecting cable to the DC link with 2 screws (Braking Module connection) and 2 nuts (DC link connection).

Carry out the subsequent steps in reverse order from steps 1 – 3.

An opening above the connections for the braking resistor (R1, R2) is provided in the cover for connecting the cable to the braking resistor.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.1.4.3 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size HX

Figure 5-10 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size HX

Installing the Braking Module

The steps for the installation procedure are numbered in accordance with the diagram in front of them.

1. Insert the Braking Module.
2. Tighten the 4 retaining screws for the Braking Module.
3. Install the connection bracket for the DC link (DCPA/DCNA).

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.1.4.4 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size JX

Figure 5-11 Installing the Braking Module in a Smart Line Module / Active Line Module / Motor Module, frame size JX

Installing the Braking Module

The steps for the installation procedure are numbered in accordance with the diagram.

1. Insert the Braking Module.
2. Tighten the 4 retaining screws for the Braking Module.
3. Install the connection bracket for the DC link (DCPA/DCNA).

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.1.4.5 Installing the Braking Module in a Basic Line Module, frame size FB

Figure 5-12 Installing the Braking Module in a Basic Line Module, frame size FB

Installing the Braking Module

The steps for the installation procedure are numbered in accordance with the diagram.

1. Unscrew the 3 screws for the blanking plate.
Remove the plate.
2. Insert the Braking Module where the cover used to be and secure it using the 3 screws (from step 1).
3. Secure the connecting cable to the DC link with 2 screws (Braking Module connection) and 2 nuts (DC link connection).

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.1.4.6 Installing the Braking Module in a Basic Line Module, frame size GB

Figure 5-13 Installing the Braking Module in a Basic Line Module, frame size GB

Installing the Braking Module

Note

To install a frame size GX Braking Module in a frame size GB Basic Line Module a cable harness set is required, which is available under order number 6SL3366-2NG00-0AA0.

The steps for the installation procedure are numbered in accordance with the diagram.

1. Unscrew the 3 screws for the blanking plate.
Remove the plate.
2. Insert the Braking Module where the cover used to be and secure it using the 3 screws (from step 1).
3. Use the connecting cable in the cable harness set (order number 6SL3366-2NG00-0AA0).
4. Secure the connecting cable to the DC link with 2 screws (Braking Module connection) and 2 nuts (DC link connection).

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

5.2 Braking resistors

5.2.1 Description

The excess energy of the DC link is dissipated via the braking resistor.

The braking resistor is connected to a Braking Module. The braking resistor is positioned outside the cabinet unit or switchgear room. This enables the resulting heat loss around the Basic Line Modules, Smart Line Modules, Active Line Modules, or Motor Modules to be dissipated. This reduces the level of air conditioning required.

Resistors with rated powers of 25 kW and 50 kW are available.

Greater outputs can be implemented by connecting Braking Modules and braking resistors in parallel. In this case, the Braking Modules are installed in the air duct of the Basic Line Modules, Smart Line Modules, Active Line Modules, or Motor Modules. Depending on the size of the respective module, up to three mounting locations are available.

Since the braking resistors can be used in converters with a wide voltage range, the voltage can be adjusted (for example, to reduce the voltage stress on the motor and converter) by setting the response thresholds on the Braking Module.

A thermostat monitors the braking resistor for excessively high temperatures and issues a signal on a floating contact if the limit value is exceeded.

5.2.2 Safety information

CAUTION

A cooling clearance of 200 mm must be maintained on all sides of the component (with ventilation meshes).

CAUTION

The cables for the braking resistor must be routed to prevent short-circuiting and ground faults in accordance with IEC 61800-5-2:2007, Table D.1.
--

This can be accomplished, for example, by:
--

- | |
|---|
| <ul style="list-style-type: none">• Eliminating the risk of mechanical damage to the cables• Using cables with double insulation• Maintaining adequate clearance, using spacers, for example• Laying the cables in separate cable ducts or pipes |
|---|

Note

The connecting cables to the Braking Module in the Basic Line Module, Smart Line Module, Active Line Module, or Motor Module must be kept as short as possible (maximum of 100 m).

The braking resistors are only suitable for floor mounting.

Sufficient space must be available for dissipating the energy converted by the braking resistor.

A sufficient distance from flammable objects must be ensured.

The braking resistor must be installed as a free-standing unit.

Objects must not be placed on or anywhere above the braking resistor.

The braking resistor should not be installed underneath fire detection systems, since these could be triggered by the resulting heat.

For outdoor installation, a hood should be provided to protect the braking resistor against precipitation (in accordance with degree of protection IP20).

CAUTION

The surface temperature of the braking resistors may exceed 80 °C.
--

5.2.3 Dimension drawing

Figure 5-14 Dimension drawing braking resistor 25 kW/125 kW

Figure 5-15 Dimension drawing braking resistor 50 kW/250 kW

5.2.4 Electrical connection

WARNING

The Braking Module must only be connected when the Basic Line Module, Smart Line Module, Active Line Module, or Motor Module has been disconnected from the power supply and the DC link has been discharged.

CAUTION

The cables for the braking resistor must be routed to prevent short-circuiting and ground faults in accordance with IEC 61800-5-2:2007, Table D.1.

This can be accomplished, for example, by:

- Eliminating the risk of mechanical damage to the cables
- Using cables with double insulation
- Maintaining adequate clearance, using spacers, for example
- Laying the cables in separate cable ducts or pipes

CAUTION

The length of the connecting cables between the Braking Module and external braking resistor must not exceed 100 m.

Recommended cable cross-sections:

- For 25/125 kW: 35 mm²
- For 50/250 kW: 50 mm²

Thermostatic switch

A thermostatic switch is installed to protect the braking resistor against overload. Its floating contacts must be integrated in the fault chain on the line side.

Table 5- 7 Thermostatic switch connection

Duty cycle

Figure 5-16 Duty cycle for braking resistors

Motor-side power components

6.1 Sine-wave filter

6.1.1 Description

If a sine-wave filter is connected to the output of the Motor Module, the voltage between the motor terminals is virtually sinusoidal. This reduces the voltage load on the motor windings and prevents motor noise that would be induced by the pulse frequency.

Sine-wave filters are available up to a converter type power rating of 250 kW (without consideration for derating).

The pulse frequency of the Motor Modules must be set to 4 kHz for the sine-wave filters. This reduces the output current of the Motor Module.

When a sine-wave filter is used, the available output voltage decreases by 15 %.

Figure 6-1 Sine-wave filter

6.1.2 Safety information

CAUTION

The 100 mm cooling clearances above and to the side of the components must be observed.

Note

The connecting cables to the Motor Module must be kept as short as possible (max. 5 m).

CAUTION

The connections must not be interchanged:

- Incoming cable to the Motor Modules 1U1, 1V1, 1W1, and
- Outgoing cable to the load 1U2, 1V2, 1W2.

Non-observance may damage the sine-wave filter.

CAUTION

If sine-wave filters are used that have not been approved for SINAMICS by SIEMENS, the Motor Modules may be damaged or may malfunction.

CAUTION

The surface temperature of the sine-wave filters can exceed 80 °C.

CAUTION

If a sine-wave filter is connected to the Motor Module, the converter must be activated during commissioning (p0230 = 3) to prevent the filter from being destroyed.

If a sine-wave filter is connected to the Motor Module, the Motor Module must not be operated without a connected motor because otherwise the filter can be destroyed.

CAUTION

The maximum permissible output frequency when sine-wave filters are used is 150 Hz.

DANGER

Sine-wave filters discharge a high leakage current to the protective ground conductor. Due to the high leakage current associated with sine-wave filters, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

6.2 Motor reactors

6.2.1 Description

Motor reactors reduce the voltage stress on the motor windings by reducing the voltage gradients at the motor terminals that occur when motors are fed from drive converters. At the same time, the capacitive charge/discharge currents that also occur on the output of the Motor Module when long motor cables are used are reduced.

6.2.2 Safety information

CAUTION

The 100 mm cooling clearances above and to the side of the components must be observed.

Note

The connecting cables to the Motor Module must be kept as short as possible (max. 5 m).

CAUTION

Using motor reactors not approved by SIEMENS for SINAMICS can result in thermal damage to the reactor.

**CAUTION**

The surface temperature of the motor reactors can exceed 80 °C.

CAUTION

If a motor reactor is connected to the Motor Module, it is essential that it is activated during commissioning (p0230 = 1).

CAUTION

The maximum permissible output frequency when sine-wave filters are used is 150 Hz.

CAUTION

The maximum permissible pulse frequency when motor reactors are used is 2.5 Hz or 4 kHz.

6.3 dv/dt filter plus Voltage Peak Limiter

6.3.1 Description

The dv/dt filter plus Voltage Peak Limiter comprises two components: the dv/dt reactor and the voltage-limiting network (Voltage Peak Limiter), which cuts off the voltage peaks and returns energy to the DC link. The dv/dt filters plus Voltage Peak Limiter must be used for motors for which the proof voltage of the insulation system is unknown or insufficient.

Dv/dt filters plus Voltage Peak Limiters limit the rate of voltage rise to values $< 500 \text{ V}/\mu\text{s}$ and the typical voltage peaks with rated line voltages to the values below:

- $< 1000 \text{ V}$ at $U_{\text{line}} < 575 \text{ V}$
- $< 1250 \text{ V}$ at $660 \text{ V} < U_{\text{line}} < 690 \text{ V}$.

Components

The order numbers of the individual components (dv/dt reactor and voltage peak limiter) are listed in the following table:

WARNING

When a dv/dt filter is used, the pulse frequency of the Motor Module must not exceed 2.5 kHz or 4 kHz. If a higher pulse frequency is set, then this could destroy the dv/dt filter.

Table 6- 16 Max. pulse frequency when a dv/dt filter is used in units with a rated pulse frequency of 2 kHz

Order no. 6SL3320-...	Power [kW]	Output current for a pulse frequency of 2 kHz [A]	Max. pulse frequency when a dv/dt filter is used
Supply voltage 510 – 750 V DC			
1TE32-1AAx	110	210	4 kHz
1TE32-6AAx	132	260	4 kHz
1TE33-1AAx	160	310	4 kHz
1TE33-8AAx	200	380	4 kHz
1TE35-0AAx	250	490	4 kHz

Table 6- 17 Max. pulse frequency when a dv/dt filter is used in units with a rated pulse frequency of 1.25 kHz

Order no. 6SL3320-...	Power [kW]	Output current for a pulse frequency of 1.25 kHz [A]	Max. pulse frequency when a dv/dt filter is used
Supply voltage 510 – 750 V DC			
1TE36-1AAx	315	605	2.5 kHz
1TE37-5AAx	400	745	2.5 kHz
1TE38-4AAx	450	840	2.5 kHz
1TE41-0AAx	560	985	2.5 kHz
1TE41-2AAx	710	1260	2.5 kHz
1TE41-4AAx	800	1405	2.5 kHz
Supply voltage 675 – 1080 V DC			
1TG28-5AAx	75	85	2.5 kHz
1TG31-0AAx	90	100	2.5 kHz
1TG31-2AAx	110	120	2.5 kHz

1TG31-8AAx	160	175	2.5 kHz
1TG32-2AAx	200	215	2.5 kHz
1TG32-6AAx	250	260	2.5 kHz
1TG33-3AAx	315	330	2.5 kHz
1TG34-1AAx	400	410	2.5 kHz
1TG34-7AAx	450	465	2.5 kHz
1TG35-8AAx	560	575	2.5 kHz
1TG37-4AAx	710	735	2.5 kHz
1TG38-1AAx	800	810	2.5 kHz
1TG38-8AAx	900	910	2.5 kHz
1TG41-0AAx	1000	1025	2.5 kHz
1TG41-3AAx	1200	1270	2.5 kHz

6.3.2 Safety information

CAUTION

The cooling clearances of 100 mm above and below the components must be observed.

Note

The connecting cables to the Motor Module must be kept as short as possible (max. 5 m).

CAUTION

The terminals on the voltage limiting network (Voltage Peak Limiter) must always be connected as follows:

- Cable from the DC link to the Motor Module at DCPS, DCNS and
- Cable to the dv/dt reactor 1U2, 1V2, 1W2.

Failure to connect the terminals correctly could damage the Voltage Peak Limiter.

CAUTION

When using dv/dt filters that SIEMENS has not approved for SINAMICS, then these dv/dt filters can be thermally damaged.

CAUTION

The surface temperature of the dv/dt reactors may exceed 80 °C.

CAUTION

If a dv/dt filter plus Voltage Peak Limiter is connected to the Motor Module, it is essential that it is activated during commissioning (p0230 = 2).

CAUTION

The maximum permissible output frequency when using dv/dt filters is 150 Hz.

DANGER

dv/dt filters plus Voltage Peak Limiter discharge a high leakage current to the protective ground conductor.

Due to the high leakage current associated with dv/dt filters, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

dv/dt filter plus Voltage Peak Limiter	Connection to the DC link (DCPS/DCNS) [mm ²]	Connection between dv/dt reactor and Voltage Peak Limiter (1U2, 1V2, 1W2) [mm ²]
Line voltage 380 V – 480 V		
6SL3000-2DE32-6AA0	35	10
6SL3000-2DE35-0AA0	70	16
6SL3000-2DE38-4AA0	2 x 50	50
6SL3000-2DE41-4AA0	2 x 120	120
Line voltage 500 V – 690 V		
6SL3000-2DH31-0AA0	16	6
6SL3000-2DH31-5AA0	16	6
6SL3000-2DH32-2AA0	70	16
6SL3000-2DH33-3AA0	70	16
6SL3000-2DH34-1AA0	120	35
6SL3000-2DH35-8AA0	120	35
6SL3000-2DH38-1AA0	2 x 70	70
6SL3000-2DH41-3AA0	2 x 120	120

CAUTION

The connection to the DC link of the Motor Module must be routed according to IEC 61800-5-2:2007, Table D.1 in order to rule out short-circuiting or ground faults.

This can be accomplished, for example, by:

- Eliminating the risk of mechanical damage to the cables
- Using cables with double insulation
- Maintaining adequate clearance, using spacers, for example
- Laying the cables in separate cable ducts or pipes

Note

The connections should be kept as short as possible.

The maximum cable length for the specified connections is 5 m in each case.

6.4 dv/dt filter compact plus Voltage Peak Limiter

6.4.1 Description

The dv/dt filter compact plus Voltage Peak Limiter comprises two components: the dv/dt reactor and the voltage-limiting network (Voltage Peak Limiter), which cuts off the voltage peaks and feeds back the energy into the DC link. The dv/dt filter compact plus Voltage Peak Limiter is designed for use with motors for which the voltage strength of the insulation system is unknown or insufficient.

The dv/dt filters compact plus Voltage Peak Limiter limit the voltage load on the motor cables to values in accordance with the limit value curve A as per IEC/TS 60034-25:2007.

The rate of voltage rise is limited to $< 1600 \text{ V}/\mu\text{s}$, the peak voltages are limited to $< 1400 \text{ V}$.

WARNING

When a dv/dt filter compact plus Voltage Peak Limiter is used, the drive must not be operated in uninterrupted duty with an output frequency lower than 10 Hz.

A maximum load duration of 5 minutes at an output frequency lower than 10 Hz is permissible, provided that the drive is operated with an output frequency higher than 10 Hz for a period of 5 minutes thereafter.

Uninterrupted duty at an output frequency less than 10 Hz can produce thermal overload and destroy the dv/dt filter.

WARNING

When a dv/dt filter compact plus Voltage Peak Limiter is used, the pulse frequency of the Motor Module must not exceed 2.5 kHz or 4 kHz. If a higher pulse frequency is set, then this could destroy the dv/dt filter.

Note

It is permissible to set pulse frequencies in the range between the rated pulse frequency and the relevant maximum pulse frequency when a dv/dt filter compact plus Voltage Peak Limiter is used.

Note

For current derating with increased pulse frequency, the derating of the associated Motor Module is the decisive factor.

Note

The dv/dt filters compact plus Voltage Peak Limiter of Types 1 to 3 consist of one single component. Type 4 consists of two separate components, the dv/dt reactor and the Voltage Peak Limiter.

Table 6- 30 Max. pulse frequency when a dv/dt filter compact plus Voltage Peak Limiter is used in units with a rated pulse frequency of 2 kHz

Order no. of the Motor Module 6SL3320-...	Unit rating [kW]	Output current for a pulse frequency of 2 kHz [A]	Max. pulse frequency when a dv/dt filter compact plus Voltage Peak Limiter is used
Supply voltage 510 – 750 V DC			
1TE32-1AAx	110	210	4 kHz
1TE32-6AAx	132	260	4 kHz
1TE33-1AAx	160	310	4 kHz
1TE33-8AAx	200	380	4 kHz
1TE35-0AAx	250	490	4 kHz

Table 6- 31 Max. pulse frequency when a dv/dt filter compact plus Voltage Peak Limiter is used in units with a rated pulse frequency of 1.25 kHz

Order no. of the Motor Module 6SL3320-...	Unit rating [kW]	Output current for a pulse frequency of 1.25 kHz [A]	Max. pulse frequency when a dv/dt filter compact plus Voltage Peak Limiter is used
Supply voltage 510 – 750 V DC			
1TE36-1AAx	315	605	2.5 kHz
1TE37-5AAx	400	745	2.5 kHz
1TE38-4AAx	450	840	2.5 kHz

1TG33-3AAx	315	330	2.5 kHz
1TG34-1AAx	400	410	2.5 kHz
1TG34-7AAx	450	465	2.5 kHz
1TG35-8AAx	560	575	2.5 kHz
1TG37-4AAx	710	735	2.5 kHz
1TG38-1AAx	800	810	2.5 kHz
1TG38-8AAx	900	910	2.5 kHz
1TG41-0AAx	1000	1025	2.5 kHz
1TG41-3AAx	1200	1270	2.5 kHz

6.4.2 Safety information

CAUTION

The cooling clearances of 100 mm above and below the components must be observed.

The dv/dt filters compact plus Voltage Peak Limiter must only be installed upright, to ensure that cooling air flows from bottom to top through the heatsinks on the Voltage Peak Limiter.

Note

The motor cables between the Motor Module and dv/dt filter compact, and the cables to the DC link must be kept as short as possible (max. 5 m).

CAUTION

Terminals for order numbers 6SL3000-2DE41-4EA0, 6SL3000-2DG38-1EA0 and 6SL3000-2DG41-3EA0

The terminals on the voltage limiting network (Voltage Peak Limiter) must always be connected as follows:

- Cable from the DC link to the Motor Module at DCPS, DCNS and
- Cable to the dv/dt reactor 1U2, 1V2, 1W2.

Failure to connect the terminals correctly could damage the Voltage Peak Limiter.

CAUTION

When using dv/dt filters that SIEMENS has not approved for SINAMICS, then these dv/dt filters can be thermally damaged.

CAUTION

The surface temperature of the dv/dt filters compact may exceed 80 °C.

CAUTION

If a dv/dt filter compact plus Voltage Peak Limiter is connected to the Motor Module, it is essential that it is activated during commissioning (p0230 = 2).

CAUTION

The maximum permissible output frequency when using dv/dt filters compact plus Voltage Peak Limiter is 150 Hz.

! DANGER

dv/dt filters compact plus Voltage Peak Limiter discharge a high leakage current to the protective ground conductor.

Due to the high leakage current associated with dv/dt filters, they or the relevant control cabinet must be permanently connected to PE.

According to EN 61800-5-1, Section 6.3.6.7, the minimum cross-section of the protective ground conductor must conform to the local safety regulations for protective ground conductors for equipment with a high leakage current.

! DANGER

Each component must be grounded using the specially marked PE connection.

Figure 6-18 Connecting the dv/dt filter compact plus Voltage Peak Limiter - integrated unit

Figure 6-19 Connecting the dv/dt filter compact plus Voltage Peak Limiter - separate components

Cable cross-sections

In a dv/dt filter with separate Voltage Peak Limiter (Type 4), the connections between dv/dt reactor and Voltage Peak Limiter are already installed on the Voltage Peak Limiter.

Table 6- 32 Cable cross-sections for connections between a dv/dt filter and Motor Module

dv/dt filter compact plus Voltage Peak Limiter	Cross-section [mm ²]	Connection on dv/dt filter
Type 1	16	Screw M8 / 12 Nm
Type 2	25	Screw M8 / 12 Nm
Type 3	50	Copper bar for M8 bolt / 12 Nm
Type 4	95	Copper bar for M8 bolt / 12 Nm

Table 6- 33 Connection cable enclosed for connecting dv/dt reactor and Voltage Peak Limiter

Voltage Peak Limiter	Cross-section [mm ²]	Lug for connecting 1U2 / 1V2 / 1W2 on the dv/dt reactor
Type 4	70	M12

Cable type: 600 V, UL style 3271, operating temperature 125 °C

CAUTION

The connection to the DC link of the Motor Module must be routed according to IEC 61800-5-2:2007, Table D.1 in order to rule out short-circuiting or ground faults.

This can be accomplished, for example, by:

- Eliminating the risk of mechanical damage to the cables
- Using cables with double insulation
- Maintaining adequate clearance, using spacers, for example
- Laying the cables in separate cable ducts or pipes

Note

The connections should be kept as short as possible.

The maximum cable length between Motor Module and dv/dt filter compact (motor cables and cables to the DC link) is 5 m.

An equivalent cable type must be used when replacing enclosed cables.

WARNING

The connections at the dv/dt filter compact are not designed for direct mechanical connection to the motor cables.

The customer is responsible for ensuring that mechanical loading caused by connected cables cannot bend the terminals.

Cabinet design and EMC

7.1 Information

7.1.1 General

The modular concept of SINAMICS S120 allows a wide range of potential device combinations. For this reason, it is impossible to describe each individual combination. This section instead aims to provide some basic information and general rules on the basis of which special device combinations can be constructed and to ensure electromagnetic compatibility.

The SINAMICS S120 components are designed for installation in enclosures, which can take the form of cabinet units or control boxes made of steel that provide protection against shock and other environmental influences. They are also part of the EMC concept.

7.1.2 Safety information

WARNING

When transporting the devices and replacing components, note the following:

- Some of the devices and components are heavy or top heavy.
- Due to their weight, the devices must be handled with care by trained personnel.

Serious injury or even death and substantial material damage can occur if the devices are not lifted or transported properly.

Note

When installing the cabinet unit, make sure that no foreign bodies – especially metallic objects, such as drill swarf, wire end ferrules, or cable cut-offs – fall into the device. If necessary, cover the ventilation slots.

Note

Safety regulations governing shock protection must be observed. See also EN 60204-1.

CAUTION

To ensure that the entire system functions properly, you are advised to use original Siemens accessories.

Only original DRIVE-CLiQ cables may be used for wiring the DRIVE-CLiQ nodes.

Before commissioning, check the tightening torque of all the terminal screws.

WARNING

Cable shields and unused cores/conductors of the power cables must be connected to PE potential.

Non-observance can cause lethal shock voltages.

Note

On systems with a grounded phase conductor and a line voltage >600 V AC, line-side components should be installed to limit overvoltages to overvoltage category II in accordance with IEC 61800-5-1.

Maximum cable lengths

Table 7- 1 Maximum cable lengths

Type	Maximum length [m]
24 V DC power cables ¹⁾	10
24 V signal cables ¹⁾	30
Power cable between the Motor Module and motor when using 2 motor reactors in series	300 (shielded) 450 (unshielded) 525 (shielded) 787 (unshielded)
DRIVE-CLiQ cables - Inside cabinet unit e.g. connection between CU320 and the first Motor Module or between the Motor Modules - DRIVE-CLiQ MOTION-CONNECT connecting cables for external components	70 100
Power cable between Braking Module and braking resistor	100

¹⁾ For greater lengths, suitable wiring must be provided by the user for overvoltage protection.

7.1.3 Directives

The product satisfies the protection targets of the following EU Directives applicable within the European Union:

Table 7- 3 Directives

Directive	Description
2006/95/EC	Directive of the European Parliament and Council of December 12, 2006, on the approximation of the laws of the member states relating to electrical equipment designed for use within certain voltage limits (Low-Voltage Directive)
2004/108/EC	Directive of the European Parliament and Council of December 15, 2004, which repeals directive 89/336/EEC, on the approximation of laws of the member states relating to electromagnetic compatibility (EMC Directive)

7.2 EMC-compliant design and control cabinet configuration

For detailed configuration instructions regarding the EMC-compliant design of drives and control cabinet configuration, refer to the "SINAMICS Low Voltage Configuration Manual".

7.3 Cabinet air conditioning

7.3.1 General

The minimum dimensions listed below for ventilation clearances must be observed. No other components or cables may be installed in or laid through these areas.

CAUTION

If the guidelines for installing SINAMICS S120 Chassis devices are not observed, this can significantly reduce the service life of the components and result in premature component failure.

You must take into account the following specifications when using a SINAMICS S120 Chassis drive line-up:

- Ventilation clearance
- Cabling
- Air guidance

Table 7- 4 Ventilation clearances for the components

Component	Frame size	Clearance (front) [mm]	Clearance (above) [mm]	Clearance (below) [mm]
Basic Line Module	FB, GB	40 ¹⁾	250	150
Active Interface Module	FI	40 ¹⁾	250	150
Active Interface Module	GI	50 ¹⁾	250	150
Active Interface Module	HI, JI	40 ¹⁾	250	0
Smart Line Module	GX, HX, JX	40 ¹⁾	250	150
Active Line Module	FX, GX, HX, JX	40 ¹⁾	250	150
Motor Module	FX, GX, HX, JX	40 ¹⁾	250	150

¹⁾ The clearances refer to the area around the ventilation slots on the front cover.

Note

The dimensions refer to the outer edges of the devices.

Dimension drawings are available in the relevant chapters.

7.3.2 Ventilation

The SINAMICS S120 Chassis devices are forced-ventilated by means of integrated fans. To ensure an adequate air supply, suitable openings for the inlet air (e.g., ventilation slots in the cabinet door) and discharged air (e.g., by means of a hood) must be provided.

The cooling air must flow through the components vertically from bottom (cooler region) to top (region heated by operation).

You must ensure that the air is flowing in the right direction. You must also ensure that the warm air can escape at the top. The specified ventilation clearances must be observed.

Note

Cables must not be routed directly on the components. The ventilation grilles must not be covered.

Cold air must not be allowed to blow directly onto electronic equipment.

CAUTION
Air guidance, as well as the arrangement of and settings for the cooling equipment, must be chosen in such a way as to prevent condensation even with the highest relative humidity. If necessary, cabinet enclosure heating may have to be installed.

Figure 7-1 Air guidance for Active Interface Module, frame sizes FI, GI

Figure 7-2 Air guidance for Active Interface Module, frame sizes HI, JI

Figure 7-3 Air guidance for Smart Line Module, Active Line Module, Motor Module, frame sizes FX, GX

Figure 7-4 Air guidance for Smart Line Module, Active Line Module, Motor Module, frame sizes HX, JX

Figure 7-5 Air guidance for Basic Line Module, frame sizes FB, GB

Devices must not be operated in an "air short circuit", since this can damage equipment or cause it to fail.

The pull of the fan causes negative pressure to build up at the ventilation openings in the cabinet doors. The pressure is dependent on the volume flow rate and the hydraulic cross-section of the openings.

The air, which blows out of the top of the device, accumulates under the top cover/hood, resulting in overpressure.

The difference between the overpressure at the top of the cabinet and the negative pressure at the bottom creates a flow of air (air short circuit). This can vary in strength depending on the cross-section of the door and cover openings and the volumetric flow of the fan.

Due to the flow of air within the cabinet, the device fan draws in pre-heated air. This heats up the components considerably and the fan does not function effectively.

CAUTION

Devices must not be operated in an air short circuit, since this can cause it to fail.
--

Suitable barriers must be in place to prevent an air short circuit.

Barriers must be installed in such a way that no air can flow along the outer sides on the top and bottom of the devices. In particular, air must be prevented from flowing from the top (warm discharged air) to the bottom (cold cooling air). Suitable plates can be used as barriers. The barriers must reach up to the side panels or cabinet doors. They must be set up in such a way that the outgoing air current is not forced into the cabinet cross-beams but is instead diverted around them. Barriers must be in place for all degrees of protection higher than IP20.

The cabinets adjacent to the converter cabinets must also be taken into account when barriers are installed.

To ensure adequate ventilation of the equipment, the minimum opening sizes specified in the following table must be observed.

The specified opening cross-sections comprise several small openings. To ensure that pressure loss is kept to a minimum and that the flow resistance does not become too great at these mesh-type openings, the cross sectional area of each opening must be around at least 190 mm² (e.g. 7.5 mm x 25 mm or 9.5 mm x 20 mm).

To ensure that the devices operate continuously, suitable measures must be taken to prevent the ingress of dirt and dust. Wire lattices (wire fabric DIN 4189-St-vzk-1x0.28) or filter mats (min. filter class G2) must be used for this purpose. The choice of filter mats depends on the required degree of protection and the ambient conditions. If cabinets are installed in an environment containing fine dust particles or oil vapors, micro-filter mats must be used to prevent the devices from becoming contaminated.

If dirt filters are used, the specified opening cross-sections and the filter areas must be adjusted upwards.

CAUTION

If dirt filters are used, the specified replacement intervals must be observed.

If the filter mats are heavily contaminated, the volume of air drawn is reduced due to the increased flow resistance. This can cause the fans integrated in the devices to overload, or it could cause the devices themselves to overheat and become damaged.

The opening cross-sections specified in the table refer in each case to one device. If more than one device is installed in a cabinet, the opening cross-section increases accordingly. If the required openings cannot be made in the cabinet, the devices must be distributed across several cabinets, which are separated from each other by means of partitions.

7.3 Cabinet air conditioning

The warm air must be discharged via the top cover/hood or via side openings in the cabinet at the level of the top of the device. The size of the opening cross-section must also be taken into account here.

With degrees of protection higher than IP20 and if a hood is used, it may be necessary to use an "active" hood. An "active" hood contains fans that blow the air current forwards. The hood is closed, with the exception of the air outlet point.

If you choose an "active" hood, you must ensure that the fans are sufficiently powerful to prevent air from accumulating in the cabinet. If air accumulates, the cooling capacity is reduced. This can overheat and destroy the devices. The air capacity of the fans should at least be equivalent to the device fan data.

Table 7- 5 Volume flow rate, opening cross-sections

Maintenance and Servicing

8.1 Chapter content

This chapter provides information on the following:

- Maintenance and servicing procedures that have to be carried out on a regular basis to ensure the availability of the components.
- Exchanging device components when the unit is serviced
- Forming the DC link capacitors

DANGER

Before carrying out any maintenance or repair work on the de-energized unit, wait for 5 minutes after switching off the supply voltage. This allows the capacitors to discharge to a harmless level ($< 25\text{ V}$) after the supply voltage has been switched off.

Before starting work, you should also measure the voltage after the 5 minutes have elapsed. The voltage can be measured on DC link terminals DCP and DCN.

DANGER

When the external power supply or the external 230 V AC auxiliary supply is connected, dangerous voltages are still present in components even when the main circuit-breaker is open.

8.2 Maintenance

The devices comprise mostly electronic components. Apart from the fan(s), therefore, they contain hardly any components that are subject to wear or that require maintenance or servicing. Maintenance is intended to ensure that the equipment remains in the specified condition. Dirt and contamination must be removed regularly and parts subject to wear replaced.

The following points must generally be observed.

Cleaning

Dust deposits

Dust deposits inside the device must be removed at regular intervals (or at least once a year) by qualified personnel in line with the relevant safety regulations. The unit must be cleaned using a brush and vacuum cleaner, and dry compressed air (max. 1 bar) for areas that cannot be easily reached.

Ventilation

The ventilation openings in the devices must never be obstructed. The fans must be checked to make sure that they are functioning correctly.

Cable and screw terminals

Cable and screw terminals must be checked regularly to ensure that they are secure in position, and if necessary, retightened. Cabling must be checked for defects. Defective parts must be replaced immediately.

Note

The actual intervals at which maintenance procedures are to be performed depend on the installation conditions (cabinet environment) and the operating conditions.

Siemens offers its customers support in the form of a service contract. For further details, contact your regional office or sales office.

8.3 Maintenance

Servicing involves activities and procedures for maintaining and restoring the specified condition of the devices.

Required tools

The following tools are required for replacing components:

- Spanner or socket spanner (w/f 10)
- Spanner or socket spanner (w/f 13)
- Spanner or socket spanner (w/f 16/17)
- Spanner or socket spanner (w/f 18/19)
- Hexagon-socket spanner (size 8)
- Torque wrench from 5 Nm to 50 Nm
- Screwdriver size 1 / 2
- Screwdriver Torx T20
- Screwdriver Torx T30

Tightening torques for current-carrying parts

When securing connections for current-carrying parts (DC link/motor connections, busbars), you must observe the following tightening torques.

Table 8- 1 Tightening torques for connecting current-carrying parts

Bolt	Torque
M6	6 Nm
M8	13 Nm
M10	25 Nm
M12	50 Nm

8.3.1 Installation device

Description

The installation device is used for installing and removing the power blocks for the Basic Line Modules, Smart Line Modules, Active Line Modules, and Motor Modules in chassis format.

It is used as a mounting aid and is placed in front of and secured to the module. The telescopic rails allow the withdrawable device to be adjusted according to the height at which the power blocks are installed. Once the mechanical and electrical connections have been undone, the power block can be removed from the module, whereby the power block is guided and supported by the guide rails on the withdrawable devices.

Figure 8-1 Installation device

Order number

The order number for the installation device is 6SL3766-1FA00-0AA0.

8.3.2 Using crane lifting lugs to transport power blocks

Crane lifting lugs

The power blocks are fitted with crane lifting lugs for transportation on a lifting harness in the context of replacement.

The positions of the crane lifting lugs are illustrated by arrows in the figures below.

WARNING
--

A lifting harness with vertical ropes or chains must be used to prevent any risk of damage to the housing.
--

CAUTION

The power block busbars must not be used to support or secure lifting harnesses for the purpose of transportation.
--

Figure 8-2 Crane lifting lugs on power block frame size FX, GX, FB

Figure 8-3 Crane lifting lugs on HX, JX power block

Note

On HX and JX power blocks, the front crane lifting lug is located behind the busbar.

Figure 8-4 Crane lifting lugs on power block frame size GB

8.4 Replacing components

8.4.1 Safety information

WARNING

When transporting the devices and replacing components, note the following:

- Some of the devices and components are heavy (e.g. > 30 kg) and top heavy.
- Due to their weight, the devices must be handled with care by trained personnel.
- Serious injury or even death and substantial material damage can occur if the devices are not lifted or transported properly.

WARNING

The devices are operated with high voltages.

All connection work must be carried out when the cabinet is de-energized!

All work on the device must be carried out by trained personnel only. Death, serious injury, or substantial material damage can result if these warnings are not taken into account.

Work on an open device must be carried out with extreme caution because external supply voltages may be present. The power and control terminals may be live even when the motor is not running.

Dangerously high voltage levels are still present in the device up to five minutes after it has been disconnected due to the DC link capacitors. For this reason, the cabinet should not be opened until a reasonable period of time has elapsed.

DANGER

Five safety rules

When carrying out any kind of work on electrical devices, the "five safety rules" according to EN 50110 must always be observed:

1. Disconnect the system.
2. Protect against reconnection.
3. Make sure that the equipment is de-energized.
4. Ground and short-circuit.
5. Cover or enclose adjacent components that are still live.

8.4.2 Replacing the power block, Active Line Module, and Motor Module, frame size FX

Replacing the power block

Figure 8-5 Replacing the power block, Active Line Module and Motor Module (type FX)

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Unscrew the connection to the line or to the motor (3 screws).
2. Unscrew the connection to the DC link (4 screws).
3. Remove the retaining screws at the top (2 screws).
4. Remove the retaining screws at the bottom (2 screws).
5. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
6. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
7. Remove the mounts for the Control Interface Module (2 nuts) and carefully pull out the Control Interface Module.

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

8. Disconnect the plug-in connections for the fiber-optic cables and signal cables (5 plugs).
9. Disconnect the plug for the thermocouple.
10. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.3 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size GX

Replacing the power block

Figure 8-6 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size GX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Unscrew the connection to the line or to the motor (3 screws).
2. Unscrew the connection to the DC link (4 screws).
3. Remove the retaining screws at the top (2 screws).
4. Remove the retaining screws at the bottom (2 screws).
5. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
6. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
7. Remove the mount for the Control Interface Module (1 nut) and carefully pull out the Control Interface Module.

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

8. Disconnect the plug-in connections for the fiber optic cables and signal cables (5 plugs) and release the cable connectors for the signal cables (2 connectors).
9. Disconnect the plug for the thermocouple.
10. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.4 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size HX

Replacing the left-hand power block

Figure 8-7 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size HX - left power block

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the busbar (6 screws).
2. Unscrew the connection to the DC link (8 nuts).
3. Remove the retaining screw at the top (1 screw).
4. Remove the retaining screws at the bottom (2 screws).
5. Disconnect the plug-in connections for the fiber-optic cables and signal cables (2 plugs).
6. Remove the connection for the current transformer and associated PE connection (1 plug).
7. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

Replacing the right-hand power block

Figure 8-8 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size HX - right power block

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the busbar (12 screws).
2. Unscrew the connection to the DC link (8 nuts).
3. Remove the retaining screw at the top (1 screw).
4. Remove the retaining screws at the bottom (2 screws).
5. Disconnect the plug-in connections for the fiber-optic cables and signal cables (2 plugs).
The second plug connection for the fiber optic cables cannot be disconnected until the power block has been pulled out slightly.
6. Remove the connection for the current transformer and associated PE connection (2 plug).
7. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

The second plug connection for the fiber optic cables cannot be disconnected until the power block has been pulled out slightly (see Step 5).

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).

8.4.5 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size JX

Replacing the power block

Figure 8-9 Replacing the power block, Smart Line Module, Active Line Module, and Motor Module, frame size JX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Unscrew the connection to the line or to the motor (8 screws).
2. Unscrew the connection to the DC link (8 nuts).
3. Remove the retaining screw at the top (1 screw).
4. Remove the retaining screws at the bottom (2 screws).
5. Disconnect the plug-in connections for the fiber-optic cables and signal cables (3 plugs).
6. Remove the connection for the current transformer and associated PE connection (1 plug).
7. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.6 Replacing the power block, Basic Line Module, frame size FB

Replacing the power block

Figure 8-10 Replacing the power block, Basic Line Module, frame size FB

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Unscrew the connection to the DC link (4 screws).
2. Unscrew the connection to the line connection (6 screws).
3. Remove the retaining screws at the top (2 screws).
4. Remove the retaining screws at the bottom (2 screws).
5. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
6. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
7. Remove the mounts for the Control Interface Module (1 screw and 2 nuts) and carefully pull out the Control Interface Module.

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

8. Disconnect the plug for the thermocouple.
9. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION

When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

8.4.7 Replacing the power block, Basic Line Module, frame size GB

Replacing the power block

Figure 8-11 Replacing the power block, Basic Line Module, frame size GB

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access to the power block
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Unscrew the connection to the DC link (6 screws).
2. Unscrew the connection to the line connection (9 screws).
3. Remove the retaining screws at the top (4 screws).
4. Remove the retaining screws at the bottom (2 screws).
5. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
6. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
7. Remove the mounts for the Control Interface Module (2 nuts) and carefully pull out the Control Interface Module.

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

8. Disconnect the plug for the thermocouple.
9. Unscrew the two retaining screws for the fan and attach the equipment for assembling the power block at this position.

You can now remove the power block.

CAUTION
When removing the power block, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
Carefully establish the plug-in connections and then ensure that they are secure.
The screw connections for the protective covers must only be tightened finger-tight.

8.4.8 Replacing the Control Interface Module, Active Line Module and Motor Module, frame size FX

Replacing the Control Interface Module

Figure 8-12 Replacing the Control Interface Module, Active Line Module and Motor Module, frame size FX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the mount for the CU320 (1 nut).
2. Disconnect the plug-in connections for the fiber-optic cables and signal cables (5 plugs).
3. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
4. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
5. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION

When removing the unit, ensure that you do not damage any signal cables.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.9 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size GX

Replacing the Control Interface Module

Figure 8-13 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size GX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the mount for the CU320 (1 nut).
2. Disconnect the plug-in connections for the fiber-optic cables and signal cables (5 plugs).
3. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
4. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
5. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION

When removing the unit, ensure that you do not damage any signal cables.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.10 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size HX

Replacing the Control Interface Module

Figure 8-14 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size HX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the mount for the CU320 (1 nut).
2. Disconnect the plug-in connections for the fiber-optic cables and signal cables (5 plugs).
3. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
4. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
5. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION

When removing the unit, ensure that you do not damage any signal cables.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.11 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size JX

Replacing the Control Interface Module

Figure 8-15 Replacing the Control Interface Module, Smart Line Module, Active Line Module, and Motor Module, frame size JX

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the mount for the CU320 (1 nut).
2. Disconnect the plug-in connections for the fiber-optic cables and signal cables (5 plugs).
3. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
4. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
5. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION

When removing the unit, ensure that you do not damage any signal cables.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

The fiber optic cable plugs must be remounted at their original slot. Fiber-optic cables and sockets are accordingly labeled for correct assignment (U11, U21, U31).
--

8.4.12 Replacing the Control Interface Module, Basic Line Module, frame size FB

Replacing the Control Interface Module

Figure 8-16 Replacing the Control Interface Module, Basic Line Module, frame size FB

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Disconnect the plugs for the signal cables (2 plugs).
2. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
3. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
4. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION
When removing the unit, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
Carefully establish the plug-in connections and then ensure that they are secure.

8.4.13 Replacing the Control Interface Module, Basic Line Module, frame size GB

Replacing the Control Interface Module

Figure 8-17 Replacing the Control Interface Module, Basic Line Module, frame size GB

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Disconnect the plugs for the signal cables (2 plugs).
2. Remove the DRIVE-CLiQ cables and connections on –X41 / –X42 / –X46 (6 plugs).
3. Take out the retaining screws for the IPD card (2 screws) and remove the IPD card from connector –X45 on the Control Interface Module.
4. Remove the retaining screws for the Control Interface Module (2 screws).

When removing the Control Interface Module, you have to disconnect 5 further plugs one after the other (2 at the top, 3 below).

CAUTION
When removing the unit, ensure that you do not damage any signal cables.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
Carefully establish the plug-in connections and then ensure that they are secure.

8.4.14 Replacing the fan, Smart Line Module, Active Line Module, and Motor Module, frame sizes FX, GX

Replacing the fan

Figure 8-18 Replacing the fan, Smart Line Module, Active Line Module and Motor Module, frame sizes FX, GX

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the front cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan
(2 for FX; 3 for GX).
2. Disconnect the supply cables (1 x "L", 1 x "N").

You can now carefully remove the fan.

CAUTION
When removing the fan, ensure that the cables are not damaged.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
The screw connections for the protective covers must only be tightened finger-tight.

8.4.15 Replacing the fan, Smart Line Module, Active Line Module, and Motor Module, frame size HX

Replacing the fan (left-hand power block)

Figure 8-19 Replacing the fan, Smart Line Module, Active Line Module and Motor Module, frame size HX - left power block

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the busbar (6 screws).
2. Remove the retaining screws for the fan (3 screws).
3. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

Replacing the fan (right-hand power block)

Figure 8-20 Replacing the fan, Smart Line Module, Active Line Module and Motor Module, frame size HX - right power block

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the busbars (12 screws).
2. Remove the retaining screws for the fan (3 screws).
3. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION
When removing the fan, ensure that the cables are not damaged.

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION
The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
Carefully establish the plug-in connections and then ensure that they are secure.
The screw connections for the protective covers must only be tightened finger-tight.

8.4.16 Replacing the fan, Smart Line Module, Active Line Module, and Motor Module, frame size JX

Replacing the fan

Figure 8-21 Replacing the fan, Smart Line Module, Active Line Module and Motor Module, frame size JX

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the busbar (8 screws).
2. Remove the retaining screws for the fan (3 screws).
3. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

8.4.17 Replacing the fan, Active Interface Module, frame size FI

Replacing the fan

Figure 8-22 Replacing the fan, Active Interface Module, frame size FI

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan unit (2 screws).
2. Unplug connector –X630.

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

8.4.18 Replacing the fan, Active Interface Module, frame size GI

Replacing the fan

Figure 8-23 Replacing the fan, Active Interface Module, frame size GI

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g. ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply.
- Allow unimpeded access.
- Remove the protective cover.

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan unit (3 screws).
2. Unplug connector –X630.

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened by hand.

8.4.19 Replacing the fan, Active Interface Module, frame size HI

Replacing the fan

Figure 8-24 Replacing the fan, Active Interface Module, frame size HI

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g. ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply.
- Allow unimpeded access.
- Remove the protective cover.

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan unit (3 screws).
2. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened by hand.

8.4.20 Replacing the fan, Active Interface Module, frame size JI

Replacing the fan

Figure 8-25 Replacing the fan, Active Interface Module, frame size JI

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g. ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply.
- Allow unimpeded access.
- Remove the protective cover.

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan unit (3 screws).
2. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened by hand.

8.4.21 Replacing the fan, Basic Line Module, frame sizes FB, GB

Replacing the fan

Figure 8-26 Replacing the fan, Basic Line Module, frame sizes FB, GB

Description

The average service life of the device fans is 50,000 hours. In practice, however, the service life depends on other variables (e.g., ambient temperature, degree of cabinet protection, etc.) and, therefore, may deviate from this value.

The fans must be replaced in good time to ensure that the device is available.

Preparatory steps

- Disconnect the drive line-up from the power supply
- Allow unimpeded access
- Remove the protective cover

Removal

The removal steps are numbered in accordance with the figure.

1. Remove the retaining screws for the fan
(2 screws for frame size FB, 3 screws for frame size GB)
2. Disconnect the supply cables (1 x "L", 1 x "N").

CAUTION

When removing the fan, ensure that the cables are not damaged.
--

Installation steps

For installation, carry out the above steps in reverse order.

CAUTION

The tightening torques specified in the table "Tightening torques for connecting current-conducting parts" must be observed.
--

Carefully establish the plug-in connections and then ensure that they are secure.

The screw connections for the protective covers must only be tightened finger-tight.
--

8.4.22 Replacing the fan fuses (-F10/-F11)

The order numbers for replacement fan fuses can be found in the spare parts list.

WARNING

Make sure that the cause of the fault is found before the fuse is replaced.

8.5 Forming the DC link capacitors

Description

If the Basic Line Module, Smart Line Module, Active Line Module, and Motor Module have not been used for more than two years, the DC link capacitors must be reformed. If this is not carried out, the units could be damaged after the DC link voltage is applied under load.

If the cabinet is commissioned within two years of its date of manufacture, the DC link capacitors do not need to be re-formed. The date of manufacture can be taken from the serial number on the rating plate.

Note

It is important that the storage period is calculated from the date of manufacture and not from the date that the equipment was shipped.

Rating plate

SIEMENS

SINAMICS Active Line Module CE Device designation

Input: 3AC 380 - 480 V 985 A 50 / 60 Hz

Output: DC 1.50*Input V 1103 A

630kW Duty Class I

Temperature Range: 0 - 40 °C Cooling Method: AF

Degree of Protection: IP00 Weight: 410 kg

Order Number: 1P 6SL3330-7TE41-0A50 Order number

Serial Number: S T-S92067000015 Year of manufacture

Month of manufacture

A5E00201300

Version: 2PE A

Made in EU (Germany)

Figure 8-27 Rating plate using an Active Line Module as example

Date of manufacture

The date of manufacture can be determined as follows:

Table 8- 2 Production year and month

Character	Year of manufacture	Character	Month of manufacture
S	2004	1 to 9	January to September
T	2005	O	October
U	2006	N	November
V	2007	D	December
W	2008		
X	2009		
A	2010		
B	2011		
C	2012		
D	2013		
E	2014		

Procedure in the event of repair or replacement

A replacement Line Module or Motor Module or the corresponding replacement power block has to be re-formed after being in storage for a period of more than two years.

The DC link capacitors are re-formed by applying the rated voltage without load for at least 30 minutes.

To do this, the DC link must be precharged (i.e. the Line Modules switched on), while the controller for the existing Motor Modules must not be enabled for the specified length of time.

Procedure for re-forming outside the drive line-up

Replacement power units which have to be held ready for immediate use in the event of repair or replacement can also be re-formed individually and outside the drive line-up.

For this, the equipment must be connected to the forming circuits described in the following.

Components for the forming circuit (recommendation)

- 1 fuse switch 3-phase 400 V / 10 A or 690 V / 10 A
- 3 incandescent lamps 230 V / 100 W for a line voltage of 380 to 480 V 3 AC.
Alternatively, use three 1 kΩ / 100 W resistors (e.g. GWK150J1001KLX000 from Vishay) instead of the incandescent lamps.
- 6 incandescent lamps 230 V / 100 W for a line voltage of 500 to 690 V 3 AC, where 2 incandescent lamps must be connected in series in each supply phase.
Alternatively, use three 1 kΩ / 160 W resistors (e.g. GWK200J1001KLX000 from Vishay) instead of the incandescent lamps.
- Various small components, such as lamp sockets, cable 1.5 mm², etc.

CAUTION

At a line voltage of 500 to 690 V 3 AC, the two lamp sockets connected in series must be insulated and protected from touch, because the insulation of the sockets is not designed for this high voltage.

Forming circuit for Line Modules

Note

Voltage must be supplied to Line Modules via a connected Motor Module and the associated DC link.

Figure 8-28 Forming circuit for Line Modules

Forming circuit for Motor Modules

Figure 8-29 Forming circuit for Motor Modules

Procedure

- The unit being formed must not receive a power-on command (e.g. from the keyboard, BOP20 or terminal block).
- Connect the appropriate forming circuit.
- During the forming process, the incandescent lamps must become less bright or go completely dark. If the incandescent lamps continue to be brightly lit, a fault has occurred in the drive unit or in the wiring.

Maintaining the operational readiness of individual power blocks for servicing

It is recommended that during the planned downtimes, the power blocks positioned on the line side are replaced in order to guarantee the correct functioning of the power blocks during servicing.

Q		
R		
r...	Beobachtungsparameter (nur lesbar)	Display Parameter (read only)
RAM	Speicher zum lesen und schreiben	Random Access Memory
RCD	Fehlerstrom-Schutzschalter	Residual Current Device
RJ45	Norm. Beschreibt eine 8-polige Steckverbindung mit Twisted-Pair Ethernet.	Standard. Describes an 8-pole plug connector with twisted pair Ethernet.
RO	Nur lesbar	Read Only
RS232	Serielle Schnittstelle	Serial Interface
RS485	Norm. Beschreibt die Physik einer digitalen seriellen Schnittstelle.	Standard. Describes the physical characteristics of a digital serial interface.
S		
S1	Dauerbetrieb	Continuous operation
S3	Aussetzbetrieb	periodic duty
SBC	Sichere Bremsenansteuerung	Safe Brake Control
SGE	Sicherheitsgerichtetes Eingangssignal	Safe input signal
SH	Sicherer Halt	Safe Standstill
SI	Safety Integrated	Safety Integrated
SIL	Sicherheitsintegritätsgrad	Safety Integrity Level
SLVC	Geberlose Vektorregelung	Sensorless Vector Control
SM	Sensor Module	Sensor Module

Abbreviation	Meaning, German	Meaning, English
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SPS	Speicherprogrammierbare Steuerung	Programmable Logic Controller (PLC)
STW	PROFIBUS Steuerwort	PROFIBUS control word
T		
TB	Terminal Board	Terminal Board
TIA	Totally Integrated Automation	Totally Integrated Automation
TM	Terminal Module	Terminal Module
TN	Drehstromversorgungsnetz geerdet	Three-phase supply network, grounded
TT	Drehstromversorgungsnetz geerdet	Three-phase supply network, grounded
TTL	Transistor-Transistor-Logik	Transistor-transistor logic
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
V		
VC	Vektorregelung	Vector Control
Vdc	Zwischenkreisspannung	DC link voltage
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VSM	Voltage Sensing Module	Voltage Sensing Module
VT	Variables Drehmoment	Variable Torque
W		
WZM	Werkzeugmaschine	Machine tool
X		
XML	Erweiterbare Auszeichnungssprache (Standardsprache für Web-Publishing und Dokumentenmanagement)	Extensible Markup Language
Y		
Z		
ZK	Zwischenkreis	DC Link
ZSW	PROFIBUS Zustandswort	PROFIBUS status word

Index

A

- Active Interface Modules, 50
 - Dimension drawing, 61
- Active Line Modules, 118
 - Dimension drawing, 132

B

- Backup
 - Fan (-F10/-F11), 333
- Basic Line Modules, 70
 - Dimension drawing, 80
- Basic structure
 - and regulated infeed, 29
 - and unregulated infeed, 31
 - and unregulated infeed/regenerative feedback, 30
- Basic structure of a drive system with SINAMICS S120, 29
- Braking Module, 185
 - Braking resistor connection, 191
 - Installation, 194
 - S1 – Threshold switch, 192
 - X21 digital inputs/outputs, 192
- Braking resistors, 208
 - Dimension drawing, 210

C

- Cabinet design and EMC, 267
- Cleaning, 282
- Connection example
 - Active Interface Modules, 56
 - Braking Module, 191
- Connector
 - dv/dt filter compact plus Voltage Peak Limiter, 255
 - dv/dt filter with Voltage Peak Limiter, 233
- Control cabinet design
 - Air conditioning, 270
 - Ventilation, 271
- Control Interface Module
 - Frame size FB, replacement, 311
 - Frame size FX, replacement, 303
 - Frame size GB, replacement, 313
 - Frame size GX, replacement, 305

- Frame size HX, replacement, 307
- Frame size JX, replacement, 309

D

- DC link components
 - Braking Module, 185
 - Braking resistors, 208
- Derating factors
 - Current derating as a function of the pulse frequency, 180
 - Function of installation altitude and ambient temperature, 25
- Dimension drawing
 - Active Interface Modules, 61
 - Active Line Modules, 132
 - Basic Line Modules, 80
 - Braking resistors, 210
 - dv/dt filter compact plus Voltage Peak Limiter, 257
 - dv/dt reactor, 235
 - Line filters for Basic Line Modules, 35
 - Line reactors for Basic Line Modules, 39
 - Line reactors for Smart Line Modules, 43
 - Motor Modules, 159
 - Motor reactors, 220
 - Sine-wave filter, 217
 - Smart Line Modules, 106
 - Voltage Peak Limiter, 238
- dv/dt filter, 255
 - Interfaces, 231
- dv/dt filter compact plus Voltage Peak Limiter, 255
 - Connector, 255
 - Dimension drawing, 257
 - Interfaces, 251
- dv/dt filter with Voltage Peak Limiter
 - Connector, 233
- dv/dt reactor
 - Dimension drawing, 235

E

- EMC
 - General, 267

F

- Fan

- Frame size FI, replacement, 323
- Frame size GI, replacement, 325
- Frame size HI, replacement, 327
- Frame size HX, replacement, 317
- Frame size JI, replacement, 329
- Frame size JX, replacement, 321
- Frame sizes FB, GB, replacement, 331
- Frame sizes FX and GX, replacement, 315

Fan voltage

- Active Line Modules, 136
- Basic Line Modules, 83
- Motor Modules, 163
- Smart Line Modules, 110

Forming the DC link capacitors, 334

H

Hotline, 4

I

Installation device, 284

Interfaces

- Active Interface Modules, 52
- Basic Line Modules, 73
- Braking Module, 188
- dv/dt filter, 231
- dv/dt filter compact plus Voltage Peak Limiter, 251
- Smart Line Modules, 97

IT system, 65, 82, 109

L

LEDs

- Active Interface Modules, 60
- Active Line Modules, 131
- Basic Line Modules, 79
- Motor Modules, 158
- Smart Line Modules, 105

Line filters for Basic Line Modules, 35

- Dimension drawing, 35

Line Modules, 118

- Active Line Modules, 118
- Basic Line Modules, 70
- Smart Line Modules, 93

Line reactors for Basic Line Modules, 39

- Dimension drawing, 39

Line reactors for Smart Line Modules, 43

- Dimension drawing, 43

Line-side power components, 33

- Active Interface Modules, 50

Line filters for Basic Line Modules, 34

Line reactors for Basic Line Modules, 38

Line reactors for Smart Line Modules, 42

List of abbreviations, 339

M

Maintenance, 282, 283

Maintenance and servicing, 281

Maximum cable lengths, 269

Motor Modules, 159

- Dimension drawing, 159

- Minimum cable length, 183

- Parallel connection, 182

Motor reactors, 220

- Dimension drawing, 220

Motor-side power components, 215

- dv/dt filter, 228

- dv/dt filter compact plus Voltage Peak Limiter, 248

- Motor reactors, 219

- Sine-wave filter, 215

N

Non-grounded system, 65, 82, 109

O

Operation on a non-grounded system, 65, 82, 109

Overload capability Basic Line Modules, 92

- High overload, 92

Overload capability of Active Line Modules, 143

- High overload, 143

Overload capability of the Motor Modules, 179

- High overload, 180

- Low overload, 179

Overload reserve for Smart Line Modules, 117

- High overload, 117

P

Parallel connection

- Motor Modules, 182

Power block

- Crane lifting lugs, 285

- Frame size FB, replacement, 299

- Frame size FX, replacement, 289

- Frame size GB, replacement, 301

- Frame size GX, replacement, 291

- Frame size HX, replacement, 293

Frame size JX, replacement, 297

R

Removing the noise suppression capacitor, 65, 82, 109

Replacing

- Control Interface Module, frame size FB, 311
- Control Interface Module, frame size FX, 303
- Control Interface Module, frame size GB, 313
- Control Interface Module, frame size GX, 305
- Control Interface Module, frame size HX, 307
- Control Interface Module, frame size JX, 309
- Crane lifting lugs, 285
- Fan, frame size FI, 323
- Fan, frame size GI, 325
- Fan, frame size HI, 327
- Fan, frame size HX, 317
- Fan, frame size JX, 321, 329
- Fan, frame sizes FB, GB, 331
- Fan, frame sizes FX and GX, 315
- Installation device, 284
- Power block, frame size FB, 299
- Power block, frame size FX, 289
- Power block, frame size GB, 301
- Power block, frame size GX, 291
- Power block, frame size HX, 293
- Power block, frame size JX, 297

Replacing components, 288

Residual risks, 8

S

Safety information
